### Message

'number' : integer constant too large

### Description

The value specified by *number* is too large for the number variable.

### Troubleshooting Information

The valid range of NUMBER data is -2,147,483,648 and +2,147,483,647. If you specify a value in the range +2,147,483,647 to +4,294,967,295, that value will overflow and the result will be a negative number. If the value is greater than 4,294,967,299, this error message will be displayed.

## Error C8068

### Message

'char' : unrecognized character encountered

### Description

The character specified by *char* was not recognized by the compiler.

### Troubleshooting Information

Certain characters, such as “\$” and “{,” are not recognized by the compiler.

## Error C8069

### Message

'#' : preprocessor command must be first on line

## Description

The preprocessor directive identified by the symbol # was encountered at a location where it is not allowed. A preprocessor directive must be the first keyword in any line where it appears.

## Troubleshooting Information

The symbol # is reserved to identify preprocessor directives. It has no other valid use in InstallScript. Examine the line that produced the error. If the symbol # appears in an identifier, rename that identifier there and everywhere else in the script where it is referenced.

## Error C8070

### Message

'text' : string constant expected

### Description

The character or characters specified by *text* were encountered in a statement where a string constant was expected.

### Troubleshooting Information

This error message is triggered in a switch...endswitch block when the keyword case is not followed by a string constant. In a switch...endswitch block, the constants specified in the case statements must be the same data type as the variable or expression result specified in the switch statement.

## Error C8071

### Message

colon expected

### Description

The compiler expected a colon in the statement.

### Troubleshooting Information

This error occurs in a switch statement when the constant after the keyword case is not followed by a colon. Insert a colon between the constants and the statements for that case.

## Error C8072

### Message

'elseif' : 'elseif' cannot follow 'else'

## Description

The keyword `elseif` was encountered after an `else` statement in an `if...endif` block.

## Troubleshooting Information

The keyword `elseif` cannot be used in an `if...endif` block after an `else` statement. Restructure the `if...endif` block to avoid this error.

## Error C8073

### Message

'text' : missing 'then' keyword

### Description

The character or characters specified by text were encountered in an `if` block where the keyword `then` was expected.

### Troubleshooting Information

Locate the `if` statement that immediately precedes the error location. Insert the keyword `then` after the conditional expression that follows the keyword `if`.

## Error C8074

### Message

'else' : 'else' clause already encountered

### Description

Two `else` statements were encountered in an `if...endif` block.

### Troubleshooting Information

An `if...endif` block can include only one `else` branch. If you require multiple conditional branching, use an `if...endif` block that includes `elseif` statements or a `switch...endswitch` block instead.

## Error C8075

### Message

'text' : 'default' label already encountered

### Description

A second default case was encountered in a `switch...endswitch` statement.

## Troubleshooting Information

A switch...endswitch statement can include only one instance of the keyword default to specify a default case. Restructure the switch....endswitch statement to eliminate one of the default cases.

In some versions of InstallShield, this error message is displayed when multiple case labels are encountered in a switch block.

## Error C8076

### Message

'case' : multiple case labels for statement

### Description

The compiler encountered the keyword case where it expected to find the statement or statements to be executed for the last defined case.

## Troubleshooting Information

The case statement that immediately precedes the character or characters specified by *text* is incomplete. It may be missing a terminating semicolon.

In some versions of InstallShield, this error message is displayed when more than one default statement is encountered in a switch block.

## Error C8077

### Message

'name' : label already defined

### Description

The label indicated by *name* has already been used in the main program block or function.

## Troubleshooting Information

Each label in the program block or in a function block must be unique.

## Error C8078

### Message

label illegal in this 'for' loop

### Description

You cannot define a label within a for statement.

## Troubleshooting Tips

Examine the statement at the error location. Modify your code so that a label is no longer defined within the for statement.

### Error C8079

#### Message

'text' : invalid statement

#### Description

The statement at the location indicated by *text* specifies a process that is not allowed or is invalid in the current context.

#### Troubleshooting Tips

Examine the statement at the error location. Verify that the process is valid. Examples of invalid statements are assignment statements with a constant or an arithmetic operation on the left side of the assignment operator and an end statement directly below a label.

If the statement at the error location is valid, examine statement blocks (such as record declarations, control statements and function definitions) in the lines above the error location. Verify that each statement block is terminated with the correct keyword.

### Error C8080

#### Message

'text' : missing arguments for function

#### Description

The character or characters specified by *text* were encountered after a function call where an argument list was expected.

#### Troubleshooting Information

Determine which arguments are required by the function and revise the call to include a complete argument list within parentheses.

### Error C8081

#### Message

'text' : invalid result for assignment

## Description

The character or characters specified by *text* cannot be assigned the value specified by the assignment statement.

## Troubleshooting Information

This error occurs when you attempt to assign a value to a structure. InstallScript does not allow direct assignment to a structure. You must assign a value to each member of the structure individually.

## Error C8082

### Message

'text' : missing '(' after switch

### Description

The character or characters specified by *text* were encountered in a switch...endswitch block at a location where a left parenthesis was expected.

### Troubleshooting Information

Examine the switch statement in which this error occurred. The expression that follows the keyword switch must be enclosed within parentheses.

## Error C8083

### Message

'text' : missing ')' after switch

### Description

The character or characters specified by *text* were encountered in a switch...endswitch block at a location where a right parenthesis was expected.

### Troubleshooting Information

Examine the switch statement in which this error occurred. The expression that follows the keyword switch must be enclosed within parentheses.

## Error C8084

### Message

'text' : missing 'case' after switch

### Description

The character or characters specified by *text* were encountered in a switch...endswitch block at a location where a case statement was expected.

### Troubleshooting Information

This error will occur if the switch statement is terminated with a semicolon or is not followed immediately by a case statement.

## Error C8085

### Message

'text' : missing '='

### Description

The character or characters specified by *text* were encountered in a for...endfor block at a location where an equal sign was expected.

### Troubleshooting Information

This error occurs when the equal sign is missing in the expression that follows the keyword for. Examine the for statement at which the error occurred and verify that the expression that follows the keyword for is structured correctly.

## Error C8086

### Message

'text' : missing 'to' or 'downto'

### Description

The character or characters specified by *text* were encountered in a for...endfor block at a location where an equal sign was expected.

### Troubleshooting Information

This error occurs when the keyword to or downto is missing in a for statement.

## Error C8087

### Message

cannot return value from program

### Description

The main program block contains a return statement. You cannot return a value from a program.

### Troubleshooting Information

Remove the return statement from the program block.

## Error C8088

### Message

'endif' : not inside if statement

### Description

The keyword endif could not be matched to a previous if statement.

### Troubleshooting Information

Examine the if...endif block at the error location. Verify that the keyword endif has a corresponding if statement. This error is often triggered after an earlier error in an if...endif block.

## Error C8089

### Message

'endfor' : not inside for statement

### Description

The keyword endfor could not be matched to a previous for statement.

### Troubleshooting Information

Examine the for...endfor block at the error location. Verify that the keyword endfor has a corresponding for statement. This error is often triggered after an earlier error in a for...endfor block.

## Error C8090

### Message

'until' : not inside repeat statement

### Description

The keyword until could not be matched to a previous repeat statement.

## Troubleshooting Information

Examine the repeat...until block at the error location. Verify that the keyword until has a corresponding repeat statement. This error is often triggered after an earlier error in a repeat...until block.

### Error C8091

#### Message

'endwhile' : not inside while statement

#### Description

The keyword endwhile could not be matched to a previous while statement.

#### Troubleshooting Information

Examine the while...endwhile block at the error location. Verify that the keyword endwhile has a corresponding while statement. This error is often triggered after an earlier error in a while...endwhile block.

### Error C8092

#### Message

'name' : function called but not defined

#### Description

The function specified by *name* has been prototyped and called in the body of the script, but it has not been defined.

#### Troubleshooting Information

This error can occur if the function name is not spelled identically in the prototype, the function call and the function definition. It can also occur if the function definition appears in a file that should have been included (with an #include statement) but was not.

### Error C8093

#### Message

'name' : size required for string in typedef

#### Description

The identifier specified by *name* is a string that has been defined as a member in a typedef block, but it does not include a size specification.

## Troubleshooting Information

Specify the size of all STRING declarations in a structure—InstallScript's autosizing feature does not work in typedef statements.

### Error C8097

#### Message

'text' :syntax error

#### Description

The character or characters specified by *text* triggered an unclassified syntax error.

#### Troubleshooting Information

This error message is triggered for syntax errors for which there is not a specific error message.

### Error C8098

#### Message

'text' : missing '.name' after DLL name

#### Description

The character or characters specified by *text* were encountered after a DLL file name, where a function in the DLL file was expected.

#### Troubleshooting Information

When calling a function from a DLL, specify the function name, not the DLL file name.

### Error C8099

#### Message

'text' : DLL function name expected

#### Description

The character or characters specified by *text* were encountered after a DLL file name, where a function in the DLL file was expected.

#### Troubleshooting Information

This error occurs when the function name specified with a DLL file name has not been declared in a prototype statement. Verify that this function has been prototyped; if it has, check the spelling of the function name.

## Error C8100

### Message

'name' : function not defined for this DLL

### Description

The function specified by *name* has not been prototyped for the DLL whose name precedes it.

### Troubleshooting Information

This error occurs when you have prototyped functions from two or more DLLs and then called one of those functions with the wrong DLL name.

## Error C8101

### Message

'name' : must specify DLL for this function

### Description

The function specified by *name* was prototyped twice from two different DLLs.

### Troubleshooting Information

When calling functions with identical names from two or more DLLs, you must qualify the function name by prefixing it with the DLL name followed by a period, as in the example below:

```

prototype MYDLL.UsefulFunction(INT, POINTER);
prototype YOURDLL.UsefulFunction(INT, POINTER);

export prototype MyFunc(HWND);

function MyFunc(hMSI)
    NUMBER nValue;
    POINTER psvString;
begin
    MYDLL.UsefulFunction(nValue, psvString);
end;
```

## Error C8112

### Message

'name' : typedef includes instance of self

### Description

The data type of the member specified by *name* is invalid. A typedef cannot contain a member that is an instance of itself.

## Troubleshooting Information

Restructure your typedefs to avoid this error.

### Error C8113

#### Message

'external' : local variables cannot be external

#### Description

The keyword external was encountered in data declaration within a function block.

#### Troubleshooting Information

Data that is local to a function cannot be declared external.

### Error C8114

#### Message

'text' : preprocessor user define error

#### Description

This message is triggered by an #error directive.

### Error C8115

---

**Project** ▪ This information applies to the InstallScript projects.

#### Message

'function name' : return type mismatch with prototype

#### Description

This message occurs when the return type of a script-defined function (the data type of the value returned by the function) is not the same in the function definition as it is in the function declaration. Note that if you do not explicitly specify a return type, the return type is assumed to be NUMBER.

### Error C8126

---

**Project** ▪ This information applies to the InstallScript projects.

## Message

'text' : string variable required

## Description

The character or characters specified by *text* were encountered at a location where a string declaration was expected.

## Troubleshooting Information

To declare an array other than a character array (that is, a string), use parentheses rather than brackets; for example:

```
NUMBER nArray(3);
```

## Error C8127

### Message

label illegal within try/catch/endcatch

### Description

You cannot define a label within a try...catch...endcatch statement.

### Troubleshooting Tips

Examine the statement at the error location. Modify your code so that a label is no longer defined within the try...catch...endcatch statement.

## Error C8128

### Message

goto illegal within try/catch/endcatch

### Description

You cannot use a goto statement within a try...catch...endcatch statement.

### Troubleshooting Tips

Examine the statement at the error location. Modify your code so that a goto statement is no longer used within the try...catch...endcatch statement.

## Error C8522

---

**Project** ▪ This information applies to the InstallScript projects.

Message

Access is denied.

Description

InstallShield could not open the specified file.

Troubleshooting Information

This error message may occur because the specified file is read-only. In the Windows Explorer, locate the file and check its properties.

InstallScript Fatal Errors

Fatal errors are those that prevent the compilation from continuing. They are caused by missing include files, incorrectly specified file names, disk I/O errors, and insufficient system resources; the compiler also has certain built-in limitations, such as the limit on include files, that will trigger a fatal error if exceeded.

Table 19 ▪ InstallScript Fatal Errors

| Error | Message                                 |
|-------|-----------------------------------------|
| F8501 | I/O error on action file                |
| F8502 | I/O error on debug file                 |
| F8503 | Can't open script input file            |
| F8504 | Can't open .inx output file             |
| F8505 | Can't open .dbg debug file              |
| F8506 | out of memory                           |
| F8508 | too many macro expansions in line       |
| F8509 | invalid delimiter for include file name |
| F8510 | missing delimiter for include file name |
| F8511 | can't open include file                 |
| F8512 | include file plus path is too large     |
| F8513 | too many nested #include files          |
| F8514 | #if statements too deeply nested        |
| F8515 | macro expansion buffer overflow         |

**Table 19** ▪ InstallScript Fatal Errors (cont.)

| Error        | Message                     |
|--------------|-----------------------------|
| <b>F8516</b> | maximum error count reached |
| <b>F8517</b> | too many include files      |
| <b>F8518</b> | I/O error on link file      |
| <b>F8519</b> | user define fatal error     |

## Error F8501

### Message

I/O error on action file

### Description

An error occurred when InstallShield attempted to access an intermediate file created during compilation.

### Troubleshooting Information

Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the action file; that file has the extension .obs). Among the possible causes:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - The action file may be damaged. Rename it or delete it from the Scripts folder; then compile again.
  - If the action file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  - If an action file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

## Error F8502

### Message

I/O error on debug file

### Description

An error occurred when InstallShield attempted to access an intermediate file created during compilation.

## Troubleshooting Information

Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the debug file; that file has the extension .dbg). Among the possible causes:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - The debug file may be damaged. Rename it or delete it from the Scripts folder; then compile again.
  - If the debug file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  - If a .dbg file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

## Error F8503

### Message

Can't open script input file

### Description

The compiler was unable to open the script file specified.

## Troubleshooting Information

Verify the location and name of the file. You may have misspelled the file name or specified an incorrect path.

## Error F8504

### Message

Can't open .inx output file

### Description

The compiler was unable to create the file for the compiled script.

## Troubleshooting Information

This error is generated if InstallShield cannot create or recreate the .inx file. Under normal circumstances, the following problems can cause this error:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.

- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - If the target file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  - If an .inx file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

## Error F8505

### Message

Can't open .dbg debug file

### Description

The compiler was unable to create the debug file. This file contains the information required to run the script with the debugger.

### Troubleshooting Information

The following problems will cause this error:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again.

If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:

- If the debug file is in a shared folder on a file server, verify that you have network rights to write to that folder.
- If a .dbg file exists from a previous compilation, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

## Error F8506

### Message

Out of memory

### Description

The compiler was unable to allocate sufficient memory to complete the compilation.

### Troubleshooting Information

Close any other applications that are open; then compile again. If the problem persists, restart Windows; then load InstallShield and compile again.

## Error F8508

### Message

too many macro expansions in line

### Description

The specified line contains too many macros; the maximum number of macros per line is 100.

### Troubleshooting Information

Reduce the number of macros on the line by breaking the line into two or more lines.

## Error F8509

### Message

invalid delimiter for include file name

### Description

The file name specified after the preprocessor directive `#include` is missing the initial quotation mark or angled bracket (`<`).

### Troubleshooting Information

File names specified with the preprocessor directive `#include` must be enclosed by quotation marks (“file name”) or angled brackets (`<file name>`). Insert a quotation mark or opening angled bracket before the file name. Note that if you insert an initial quotation mark, the file name must be followed by a closing quotation mark; if you insert an opening angled bracket, the file name must be followed by a closing angled bracket (`>`).

## Error F8510

### Message

missing delimiter for include file name

### Description

The file name specified after the preprocessor directive `#include` is missing the closing quotation mark or angled bracket (`>`).

### Troubleshooting Information

File names specified with the preprocessor directive `#include` must be enclosed by quotation marks (“file name”) or angled brackets (`<file name>`). Insert a quotation mark or closing angled bracket after the file name. Note that if the file name has an opening quotation mark, you must insert a quotation mark after the file name; if the file name has an opening angled bracket, you must insert a closing angled bracket (`>`).

## Error F8511

### Message

cannot open include file

### Description

The compiler was unable to find or open a file that has been included in the script.

### Troubleshooting Tips

The following problems can cause this error:

- The file name in an #include statement is misspelled.
- A file name in an #include statement is specified without a full path, but the file cannot be found in the source directory.
- You do not have rights to open files on the network drive where the file resides.
- The file is damaged.

## Error F8512

### Message

include file plus path is too large

### Description

The path specified in an #include statement exceeds the maximum length of 256 characters

### Troubleshooting Information

Move the included files to a folder that can be referenced with a path whose length is less than 256 characters.

## Error F8513

### Message

too many nested #include files

### Description

InstallScript allows nesting of include files up to a maximum of 8 levels. This limit has been exceeded.

### Troubleshooting Information

Reduce the number of nested levels.

## Error F8514

### Message

#if statements too deeply nested

### Description

InstallScript allows nesting of #if statements up to a maximum of 10 levels. This limit has been exceeded.

### Troubleshooting Information

Reduce the number of nested levels.

## Error F8515

### Message

macro expansion buffer overflow

### Description

The expansion of macros in the error line exceeds the maximum of 1024 characters.

### Troubleshooting Information

Restructure your code to eliminate this error.

## Error F8516

### Message

maximum error count reached

### Description

The maximum number of errors specified on the Compile/Link tab of the Settings dialog box has been reached.

### Troubleshooting Information

For more information about the Compile/Link tab of the Settings dialog box, see [Compile/Link Tab](#).

## Error F8517

### Message

too many include files

## Description

The maximum number of include was exceeded.

## Troubleshooting Information

A setup script can include no more than 100 source files. Combine two or more source files to bring the total number down to 100.

## Error F8518

### Message

I/O error on link file

### Description

An error occurred when InstallShield attempted to write to the link file.

### Troubleshooting Information

Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the link file (.ino).

This error might be caused by the following:

- The disk is full. Create more available disk space by deleting unwanted files and then recompile.
- The link file is damaged. Rename it or delete it from Scripts folder and then recompile.

## Error F8519

### Message

user define fatal error

### Description

This message is triggered by an #error directive.

## InstallScript Internal Errors

An internal error may occur if syntax errors exist.

C9001 internal error

## Error C9001

### Message

'text' : internal error

### Description

The character or characters specified by *text* triggered an unclassified syntax error.

### Troubleshooting Information

This error message is triggered by syntax errors for which there is not a specific error message.

## InstallScript Warnings

The compiler issues warning messages to alert you to irregularities in the script that may result in inefficiencies or run-time errors.

**Caution** - Warnings do not interrupt script compilation unless “Warnings as errors” is selected in the Compiler Settings dialog, or if the number of warnings exceeds the maximum specified. The default maximum value is 50.

Table 20 • InstallScript Warnings

| Warning Number | Message                                     |
|----------------|---------------------------------------------|
| C7501          | macro redefinition                          |
| C7502          | string/array size exceeds recommended limit |
| C7503          | function defined but never called           |
| C7505          | typedef definition differs from previous    |

## Warning C7501

### Message

'name' : macro redefinition

### Description

The identifier specified by *name* has already been used in a #define statement.

### Troubleshooting Information

If the second definition is simply a duplicate of the first, delete it. If you intended the second definition to be different from the first, rename the identifier in the second definition and update all statements in the script that reference it.

## Warning C7502

### Message

'size' : string/array size exceeds recommended limit

### Description

The numeric value specified by *size* indicates the size of a string or array that is larger than InstallScript's recommended maximum.

### Troubleshooting Information

To avoid unexpected effects, reduce the size of the array.

## Warning C7503

### Message

'name' : function defined but never called

### Description

The function specified by *name* is not called in your setup.

### Troubleshooting Information

To reduce the size of your setup, remove the unused function from your script.

## Warning C7505

### Message

'name' : typedef definition differs from previous

### Description

The data structure specified by *name* is defined in multiple library files (.obl files).

### Troubleshooting Information

If the definitions are simply duplicates, delete all but one. If you intended the definitions to be different, rename the data structures to have unique names and update all statements in the script that reference them.

# Virtualization Conversion Errors and Warnings

When you are converting a Windows Installer package to a virtual application, errors and warnings may occur. Some of the errors and warnings are applicable to any type of package virtualization, and others are specific to the virtualization solution for which you are preparing packages.

## Error -9000: Unknown Exception

The following table documents this message:

**Table 1** • Error -9000: Unknown Exception

| Category           | Description                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                       |
| <b>Message:</b>    | An unknown exception occurred.                                                                              |
| <b>Cause:</b>      | This is an unexpected internal error.                                                                       |
| <b>Resolution:</b> | Perform <a href="#">preliminary investigational steps</a> and then contact InstallShield Technical Support. |

## Error -9001: Unknown COM

The following table documents this message:

**Table 2** • Error -9001: Unknown COM

| Category           | Description                              |
|--------------------|------------------------------------------|
| <b>Type:</b>       | Error                                    |
| <b>Message:</b>    | Internal error.                          |
| <b>Resolution:</b> | Contact InstallShield Technical Support. |

## Error -9002: Error Opening Package

The following table documents this message:

**Table 3** • Error -9002: Error Opening Package

| Category        | Description                                 |
|-----------------|---------------------------------------------|
| <b>Type:</b>    | Error                                       |
| <b>Message:</b> | An error occurred when opening the package. |

**Table 3** • Error -9002: Error Opening Package

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>      | This is an unexpected internal error when reading the Windows Installer package.                                                                                                                                                                                                                                                                                                |
| <b>Resolution:</b> | <p>Check to make sure that the package is accessible to the user. If the error persists and the package is on a network share, copy the package locally (to avoid any network connection issues) and try again.</p> <p>If this does not solve the problem, perform these additional <a href="#">investigational steps</a> and then contact InstallShield Technical Support.</p> |

## Error -9003: Error Saving Package

The following table documents this message:

**Table 4** • Error -9003: Error Saving Package

| Category           | Description                                                                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                                                        |
| <b>Message:</b>    | An error occurred when saving the package.                                                                                                                                                                                                                   |
| <b>Cause:</b>      | This is an unexpected internal error when trying to save the Citrix profile.                                                                                                                                                                                 |
| <b>Resolution:</b> | <p>Check to see if the user has proper access to the location the profile is being built to.</p> <p>If this does not solve the problem, perform these additional <a href="#">investigational steps</a> and then contact InstallShield Technical Support.</p> |

## Error -9004: Process Cancelled By User

The following table documents this message:

**Table 5** • Error -9004: Process Cancelled By User

| Category           | Description                                                  |
|--------------------|--------------------------------------------------------------|
| <b>Type:</b>       | Error                                                        |
| <b>Message:</b>    | Process cancelled by user.                                   |
| <b>Cause:</b>      | The user clicked the <b>Cancel</b> button to stop the build. |
| <b>Resolution:</b> | Restart the build process.                                   |

## Error -9005: Error Creating Temporary Folder

The following table documents this message:

**Table 6** ▪ Error -9005: Error Creating Temporary Folder

| Category           | Description                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                  |
| <b>Message:</b>    | An error occurred while creating a temporary folder                                                                    |
| <b>Cause:</b>      | You encounter this error when the user does not have permission to write to C:\TMP, or the drive is out of disk space. |
| <b>Resolution:</b> | Obtain write access to C:\TMP, and free some disk space on the drive, and then rebuild the profile.                    |

## Error -9006: Error Decompressing Package

The following table documents this message:

**Table 7** ▪ Error -9006: Error Decompressing Package

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Message:</b>    | An error occurred while decompressing the package 'PackageName'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Cause:</b>      | You encounter this error when the package is a compressed Windows Installer package (.msi) and errors were generated when InstallShield attempted to perform an administrative installation to extract the files.                                                                                                                                                                                                                                                                                                                                   |
| <b>Resolution:</b> | <p>When this error occurred, you should have also received a return error code from Windows Installer. Look up that error code in the <a href="#">Windows Installer Help Library</a> to determine the cause of the problem.</p> <p>If you did not receive a return error code from Windows Installer, this error could have been caused by the package not being authored properly. In the Windows Installer package, check to see if the AdminExecuteSequence table was defined. If that table is missing, the package cannot be decompressed.</p> |

## Error -9007: File With Extension Not Found

The following table documents this message:

**Table 8** - Error -9007: File With Extension Not Found

| Category           | Description                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                     |
| <b>Message:</b>    | No file found with the extension 'ComponentKeyName'.                                                                      |
| <b>Cause:</b>      | This is an unexpected error that occurred when file extensions were being processed.                                      |
| <b>Resolution:</b> | Check to make sure that the executable for the file extension exists and that it is set as the key file in its component. |

## Error -9008: Error Extracting Icon

The following table documents this message:

**Table 9** - Error -9008: Error Extracting Icon

| Category           | Description                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                |
| <b>Message:</b>    | An error occurred while extracting the icon 'IconKeyName'                                            |
| <b>Cause:</b>      | This is an unexpected error that occurred when an icon listed in the Icon table was being extracted. |
| <b>Resolution:</b> | Verify that the Icon entry in the Icon table is valid. If necessary, replace it with a valid icon.   |

## Error -9009: Unknown Provider

The following table documents this message:

**Table 10** - Error -9009: Unknown Provider

| Category        | Description                                       |
|-----------------|---------------------------------------------------|
| <b>Type:</b>    | Error                                             |
| <b>Message:</b> | The specified provider is unknown 'ProviderName'. |
| <b>Cause:</b>   | This is an unexpected internal error.             |

**Table 10** ▪ Error -9009: Unknown Provider

| Category           | Description                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resolution:</b> | Invalid data may have been modified via the Direct Editor causing this error. Delete the <b>Release</b> you are building, and then create a new one and rebuild. |

## Error -9010: Invalid Target File Name

The following table documents this message:

**Table 11** ▪ Error -9010: Invalid Target File Name

| Category           | Description                                                                                                                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                                                            |
| <b>Message:</b>    | The target file name is invalid. 'FileName'                                                                                                                                                                                                                      |
| <b>Cause:</b>      | This is an unexpected internal error.                                                                                                                                                                                                                            |
| <b>Resolution:</b> | Invalid data may have been modified via the Direct Editor causing this error. Verify the <b>Name</b> field on the Citrix Assistant / ThinApp Assistant <b>Profile Information</b> page and make sure the name does not contain any invalid file name characters. |

## Error -9011: Error Reading MSI Table

The following table documents this message:

**Table 12** ▪ Error -9011: Error Reading MSI Table

| Category           | Description                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                       |
| <b>Message:</b>    | Unexpected error reading MSI table 'TableName'                                                              |
| <b>Cause:</b>      | This is an unexpected error that occurred when the specified Windows Installer table was being processed.   |
| <b>Resolution:</b> | Perform <a href="#">preliminary investigational steps</a> and then contact InstallShield Technical Support. |

## Error -9012: Unexpected Error in Method

The following table documents this message:

**Table 13** ▪ Error -9012: Unexpected Error in Method

| Category           | Description                                                                                                 |

| <b>Message:</b>    | Unable to determine the full path for driver 'DriverName'                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Cause:</b>      | You encounter this error when a driver referenced in the ODBCDataSource table is not being installed by the package.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Resolution:</b> | <p>This error can be resolved in one of two ways:</p> <p><b>Editing the Windows Installer Package</b></p> <ol style="list-style-type: none"><li>1. Edit the package in InstallShield using Direct Edit mode.</li><li>2. Navigate to the ISVirtualPackage table.</li><li>3. Create an entry as follows to identify the full path of the missing driver:<br/><br/><b>Name:</b> &lt;DriverName&gt; Description<br/><b>Value:</b> Path to Driver</li></ol> <p><b>Manually Installing the Driver</b></p> <p>Install the missing driver on your machine and then rebuild the Citrix profile.</p> |

## Warning -9016: Contents of Table Ignored

The following table documents this message:

**Table 17** ▪ Warning -9016: Contents of Table Ignored

| Category     | Description |
|--------------|-------------|
| <b>Type:</b> | Warning     |

**Table 17** ▪ Warning -9016: Contents of Table Ignored

| Category           | Description                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Message:</b>    | Contents of table 'TableName' will be ignored                                                                    |
| <b>Cause:</b>      | This error message identifies a known limitation of Citrix conversion.                                           |
| <b>Resolution:</b> | If the contents of the table is deemed critical, repackage the application, and then rebuild the Citrix profile. |

## Warning -9017: .NET 1.x Assembly Not Supported

The following table documents this message:

**Table 18** ▪ Warning -9017: .NET 1.x Assembly Not Supported

| Category           | Description                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                                                                 |
| <b>Message:</b>    | Assembly 'AssemblyName' is a .NET 1.x assembly and will not be converted correctly. Only .NET 2.0/3.0 assemblies are currently supported. You may wish to repackage this package first. |
| <b>Cause:</b>      | You encounter this error when attempting to convert a package containing a .NET 1.x assembly. Only .NET 2.0/3.0 assemblies are currently supported.                                     |
| <b>Resolution:</b> | Repackage the application, and then rebuild the Citrix profile.                                                                                                                         |

## Warning -9018: Custom Actions Ignored

The following table documents this message:

|-----------------|---------------------------------------------------|
| <b>Type:</b>    | Warning                                           |
| <b>Message:</b> | Custom action 'CustomActionName' will be ignored. |

**Table 19** ▪ Warning -9018: Custom Actions Ignored

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>      | <p>When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile.</p>  <p><b>Note</b> ▪ When a custom action that does not modify the system or perform any part of the installation (such as a predefined custom action or a Type 19 custom action) is encountered, no message is generated. If a Type 51 custom action is encountered (which sets a property from a formatted text string), it is automatically resolved. If a Type 35 custom action is encountered, it is resolved only if it is referenced in the Directory table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Resolution:</b> | <p>The resolution that you should perform depends upon the purpose of the custom action:</p> <ul style="list-style-type: none"><li>• If the custom action merely automatically enters a value or makes some other kind of minor modification, you can ignore this warning.</li><li>• If the custom action does something which could change the behavior of the installation (such as setting a Property), you may need to resolve this issue.</li></ul> <p>To resolve this issue, first attempt to launch the converted package on Citrix XenApp. If you receive any application errors, you need to repackage this application.</p>  <p><b>To repackage a Windows Installer package to capture custom action functionality:</b></p> <ol style="list-style-type: none"><li>1. Use the Repackaging Wizard to repackage this application. The Repackaging Wizard monitors system changes as an application is installed, and then that data is converted into a Repackager project.</li><li>2. Build the Repackager project to generate a revised Windows Installer package. This new Windows Installer package does not contain any custom actions, but (as a result of being repackaged) it will include the functionality performed by the original custom action.</li></ol> |

## Warning -9019: Conditionalized Components

The following table documents this message:

**Table 20** ▪ Warning -9019: Conditionalized Components

| Category        | Description                                                                             |
|-----------------|-----------------------------------------------------------------------------------------|
| <b>Type:</b>    | Warning                                                                                 |
| <b>Message:</b> | There exist one or more conditionalized components which may not be converted correctly |

**Table 20** ▪ Warning -9019: Conditionalized Components

| Category           | Description                                                                                                                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>      | This warning is generated when attempting to convert conditionalized components because conditions on components are not evaluated. As a result, InstallShield includes the component in the virtual package.                                                                 |
| <b>Resolution:</b> | If you do not want to include the component in the virtual package, modify your .msi package or your project file to exclude that component. Then rebuild the virtual application. If you do want the virtual package to contain this component, you can ignore this warning. |

## Error -9020: Directory With Null Parent

The following table documents this message:

**Table 21** ▪ Error -9020: Directory With Null Parent

| Category           | Description                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                |
| <b>Message:</b>    | Directory 'DirectoryName' has a null parent and will be ignored.                                                                     |
| <b>Cause:</b>      | This error occurs if a directory table entry (other than TARGETDIR) is null.                                                         |
| <b>Resolution:</b> | Evaluate the ThinApp application to see if it works. If it does not work properly, you may want to consider repackaging the package. |

## Error -9021: Unable to Extract COM Data

The following table documents this message:

**Table 22** ▪ Error -9021: Unable to Extract COM Data

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Message:</b>    | Unable to extract COM data for 'FileName'                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Cause:</b>      | <p>This Windows Installer package has an entry in the TypeLib or SelfReg table that contains COM data that InstallShield cannot convert to application data.</p> <p>Depending upon which file cannot be COM extracted, it is possible that this application will still work properly in Citrix XenApp isolation environment if you repackage this Windows Installer package with COM table mapping turned off.</p> <p>COM data is stored in the Windows Registry. So, if you repackage this Windows Installer package, the capture process will be able to obtain all of this data because it captures all modifications to the Registry and does not have to rely on COM extraction.</p> |
| <b>Resolution:</b> | To resolve this issue, you need to repackage your Windows Installer package with COM table mapping turned off.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Error -9022: Complus Table

The following table documents this message:

**Table 23** ▪ Error -9022: Complus Table

| Category           | Description                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                                                                |
| <b>Message:</b>    | The conversion process does not support data in the MSI table 'Complus'.                                                                                                                                                                                             |
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a Complus table. During the conversion process, the Complus table is not read.                                                                                          |
| <b>Resolution:</b> | The Complus table contains information needed to install COM+ applications. While Citrix XenApp supports communicating with COM+ applications, it does not support <i>installing</i> COM+ services. Therefore, this application cannot be deployed on Citrix XenApp. |

## Error -9024: FileSFPCatalog

The following table documents this message:

**Table 24** ▪ Error -9024: FileSFPCatalog

| Category           | Description                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                                     |
| <b>Message:</b>    | The conversion process does not support data in the MSI table 'FileSFPCatalog'.                                                                                                                                                           |
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a <b>FileSFPCatalog</b> table. During the conversion process, the <b>FileSFPCatalog</b> table is not read.                                   |
| <b>Resolution:</b> | The <b>FileSFPCatalog</b> table associates specified files with the catalog files used by system file protection. If this file is necessary for the function of the application, you need to use Repackager to repackage the application. |

## Warning -9026: LaunchCondition Table

The following table documents this message:

**Table 25** ▪ Warning -9026: LaunchCondition Table

| Category        | Description                                                                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>    | Warning                                                                                                                                                                                              |
| <b>Message:</b> | The conversion process does not support data in the MSI table 'LaunchCondition'.                                                                                                                     |
| <b>Cause:</b>   | You encounter this warning when the Windows Installer package that you are converting includes a LaunchCondition table. During the conversion process, the <b>LaunchCondition</b> table is not read. |

**Table 25** ▪ Warning -9026: LaunchCondition Table

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resolution:</b> | <p>The <b>LaunchCondition</b> table contains a list of conditions that all must be satisfied for the installation to begin. For example, if an application requires Windows XP to run, Windows XP is listed in the <b>LaunchCondition</b> table. Because this table is not read, no check is performed. Therefore, when a user on an operating system other than Windows XP launches this Citrix profile, the application may not function properly.</p> <p>To resolve this issue, perform one of the following tasks:</p> <ul style="list-style-type: none"><li>● <b>Option 1: Set Requirements on the Profile Requirements Page</b>—If the launch conditions only include operating system, service pack, and language requirements, open this package in the Citrix Assistant, and set those Operating System and Language requirements on the <b>Profile Requirements</b> page. Then deploy this application as a Citrix profile.</li><li>● <b>Option 2: Determine if Launch Conditions are Met</b>—Review the launch conditions listed in the table, and determine if the desktops in your enterprise meet those requirements. If all of the desktops meet those requirements, you can deploy this application as a Citrix profile.</li></ul> <p>If the desktops do not meet those requirements (such as having Internet Explorer 6.0 instead of 7.0), upgrade those desktops to meet these requirements, and then deploy this application as a Citrix profile.</p> |

## Warning -9027: LockPermissions Table

The following table documents this message:

**Table 26** ▪ Warning -9027: LockPermissions Table

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>        | Warning                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Message:</b>    | The conversion process does not support data in the MSI table 'LockPermissions'.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Cause:</b>      | You encounter this warning when the Windows Installer package that you are converting includes a LockPermissions table. During the conversion process, the LockPermissions table is not read.                                                                                                                                                                                                                                                                                                                 |
| <b>Resolution:</b> | <p>The <b>LockPermissions</b> table is used to secure individual portions of your application (files, registry keys, and created folders) in a locked-down environment.</p> <p>Citrix does not support permissions on files, registry keys, or created folders. You cannot modify permissions on any of the application's ACLs (access control lists). Because users will have full permissions when running this application in the isolation environment, this warning will not result in any problems.</p> |

## Error -9028: MoveFile Table

The following table documents this message.

**Table 27** ■ Error -9028: MoveFile Table

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Message:</b>    | The conversion process does not support data in the MSI table 'MoveFile'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a MoveFile table. During the conversion process, the MoveFile table is not read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Resolution:</b> | <p>This MoveFile table contains a list of files to be moved or copied from a specified source directory to a specified destination directory. Because this table is not read, you need to do one of the following to resolve this issue:</p> <ul style="list-style-type: none"><li>● <b>Option 1: Edit the Windows Installer Package</b>—Open the Windows Installer package in InstallShield and modify it to eliminate the use of the <b>MoveFile</b> table by installing additional files in the specified directories.</li><li>● <b>Option 2: Repackage the Application</b>—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package.</li><li>● <b>Option 3: Write a Pre-Launch Script</b>—Write a pre-launch script that performs the file moving operations identified in the <b>MoveFile</b> table upon application launch.</li></ul> |

| <b>Type:</b>    | Error                                                                                                                                                                                                         |
| <b>Message:</b> | The conversion process does not support data in the MSI table 'MsiDriverPackages'.                                                                                                                            |
| <b>Cause:</b>   | You encounter this error when the Windows Installer package that you are converting includes a <b>MsiDriverPackages</b> table. During the conversion process, the <b>MsiDriverPackages</b> table is not read. |

**Table 28** ▪ Error -9029: MsiDriverPackages Table

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resolution:</b> | <p>The <b>MsiDriverPackages</b> table includes one record for each driver package component in the application.</p> <p>Citrix XenApp does not support any type of driver. For example, when installing a printer, you can install the printer software within the isolation environment, but not the printer drivers.</p> <p>Therefore, to resolve this issue, you need to install any required drivers outside of the isolation environment on the user desktop machines.</p> |

## Warning -9030: ODBCTranslator Table

The following table documents this message:

**Table 29** ▪ Warning -9030: ODBCTranslator Table

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Message:</b>    | The conversion process does not support data in the MSI table 'ODBCTranslator'.                                                                                                                                                                                                                                                                                                                                 |
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a <b>ODBCTranslator</b> table. During the conversion process, the <b>ODBCTranslator</b> table is not read.                                                                                                                                                                                                         |
| <b>Resolution:</b> | <p>The <b>ODBCTranslator</b> table lists the ODBC translators belonging to the installation. ODBC translators translate one form of raw data into another form that can be used with a specific database type.</p> <p>Ignoring the <b>ODBCTranslator</b> table should not prevent your application from functioning properly. However, if it does, you need to use Repackager to repackage the application.</p> |

## Warning -9031: RemoveFile Table

The following table documents this message:

**Table 30** ▪ Warning -9031: RemoveFile Table

| Category        | Description                                                                 |
|-----------------|-----------------------------------------------------------------------------|
| <b>Type:</b>    | Warning                                                                     |
| <b>Message:</b> | The conversion process does not support data in the MSI table 'RemoveFile'. |

**Table 30** ▪ Warning -9031: RemoveFile Table

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a <b>RemoveFile</b> table. During the conversion process, the <b>RemoveFile</b> table is not read. This warning is displayed only if the application installation removes files during install (not uninstall).                                                                                                                                                                                                                                                                                                                                             |
| <b>Resolution:</b> | <p>The <b>RemoveFile</b> table contains a list of files to be removed. If this file removal requirement is just a clean-up step, that does not impact the function of the application, you do not need to address this issue.</p> <p>However, if the existence of the files listed in the <b>RemoveFile</b> table prevents the application from functioning, you need to set the isolation option of the files to <b>Ignore</b> so that they are not visible to the isolation environment. The <b>Ignore</b> option directs the isolation environment to always look for the file on the system (ignoring the one inside the isolation environment).</p> |

## Warning -9032: RemoveIniFile Table

The following table documents this message:

**Table 31** ▪ Warning -9032: RemoveIniFile Table

| Category           | Description                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                                                                                                                          |
| <b>Message:</b>    | The conversion process does not support data in the MSI table 'RemoveIniFile'.                                                                                                                                                                   |
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a <b>RemoveIniFile</b> table. During the conversion process, the <b>RemoveIniFile</b> table is not read.                                            |
| <b>Resolution:</b> | The <b>RemoveIniFile</b> table contains the information an application needs to delete from a .ini file. If the removal of this entry is necessary for the function of the application, you need to use Repackager to repackage the application. |

## Warning -9033: RemoveRegistry Table

The following table documents this message:

**Table 32** ▪ Warning -9033: RemoveRegistry Table

| Category        | Description                                                                     |
|-----------------|---------------------------------------------------------------------------------|
| <b>Type:</b>    | Warning                                                                         |
| <b>Message:</b> | The conversion process does not support data in the MSI table 'RemoveRegistry'. |

**Table 32** ▪ Warning -9033: RemoveRegistry Table

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a <b>RemoveRegistry</b> table. During the conversion process, the <b>RemoveRegistry</b> table is not read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Resolution:</b> | <p>The <b>RemoveRegistry</b> table contains the registry information the application needs to delete from the system registry. If this removal requirement is just a clean-up step, that does not impact the function of the application, you do not need to address this issue.</p> <p>However, if the existence of the registry keys listed in the <b>RemoveRegistry</b> table prevents the application from functioning, you need to set the isolation option of the registry keys to <b>Ignore</b> so that they are not visible to the isolation environment. The <b>Ignore</b> option directs the isolation environment to always look for the registry key on the system (ignoring the one inside the isolation environment).</p> |

## Error -9036: ISCEInstall Table

The following table documents this message:

**Table 33** ▪ Error -9036: ISCEInstall Table

| Category           | Description                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                             |
| <b>Message:</b>    | The conversion process does not support data in the MSI table 'ISCEInstall'.                                                                                                                      |
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a <b>ISCEInstall</b> table. During the conversion process, the <b>ISCEInstall</b> table is not read. |
| <b>Resolution:</b> | The <b>ISCEInstall</b> table is used to install Windows mobile applications. The conversion of mobile applications to Citrix profiles is not supported.                                           |

| Category           | Description                                                                                                                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a <b>ISComPlusApplication</b> table. During the conversion process, the <b>ISComPlusApplication</b> table is not read.                                                          |
| <b>Resolution:</b> | The <b>ISComPlusApplication</b> table contains information about COM+ applications. While Citrix XenApp supports communicating with COM+ applications, it does not support <i>installing</i> COM+ services. Therefore, this application cannot be deployed on Citrix XenApp. |

## Error -9038: ISPalmApp Table

The following table documents this message:

**Table 35** ▪ Error -9038: ISPalmApp Table

| Category           | Description                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                         |
| <b>Message:</b>    | The conversion process does not support data in the MSI table 'ISPalmApp'.                                                                                                                    |
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a <b>ISPalmApp</b> table. During the conversion process, the <b>ISPalmApp</b> table is not read. |
| <b>Resolution:</b> | The <b>ISPalmApp</b> table is used to install Palm mobile applications. The conversion of mobile applications to Citrix profiles is not supported.                                            |

## Error -9039: ISSQLScriptFile Table

The following table documents this message:

**Table 36** ▪ Error -9039: ISSQLScriptFile Table

| Category        | Description                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>    | Error                                                                                                                                                                                                     |
| <b>Message:</b> | The conversion process does not support data in the MSI table 'ISSQLScriptFile'.                                                                                                                          |
| <b>Cause:</b>   | You encounter this error when the Windows Installer package that you are converting includes a <b>ISSQLScriptFile</b> table. During the conversion process, the <b>ISSQLScriptFile</b> table is not read. |

**Table 36** ▪ Error -9039: ISSQLScriptFile Table

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resolution:</b> | <p>The <b>ISSQLScriptFile</b> table lists SQL scripts. When a Windows Installer package is installed, it can run an SQL script to update a database. An application running as a Citrix profile cannot update a database.</p> <p>To resolve this issue, you need to update the database prior to using the converted Citrix profile using one of the following methods:</p> <ul style="list-style-type: none"><li>• Use scripts to update the database manually.</li><li>• Update it by running the Windows Installer installation on one of the machines in your network that has access to that database.</li></ul> |

## Error -9040: ISVRoot Table

The following table documents this message:

**Table 37** ▪ Error -9040: ISVRoot Table

| Category           | Description                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                                                           |
| <b>Message:</b>    | The conversion process does not support data in the MSI table 'ISVRoot'.                                                                                                                                                                                        |
| <b>Cause:</b>      | You encounter this error when the Windows Installer package that you are converting includes a <b>ISVRoot</b> table. During the conversion process, the <b>ISVRoot</b> table is not read.                                                                       |
| <b>Resolution:</b> | The <b>ISVRoot</b> table installs a Web site. An application running as a Citrix profile in an isolation environment cannot create a Web site. Therefore, creating Citrix profiles for applications that create Web sites during installation is not supported. |

## Error -9041: ISXmlFile Table

The following table documents this message:

**Table 38** ▪ Error -9041: ISXmlFile Table

| Category        | Description                                                                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>    | Error                                                                                                                                                                                         |
| <b>Message:</b> | The conversion process does not support data in the MSI table 'ISXmlFile'.                                                                                                                    |
| <b>Cause:</b>   | You encounter this error when the Windows Installer package that you are converting includes a <b>ISXmlFile</b> table. During the conversion process, the <b>ISXmlFile</b> table is not read. |

**Table 38** ▪ Error -9041: ISXmlFile Table

| Category           | Description                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resolution:</b> | The <b>ISXmlFile</b> table modifies XML files. If the modification of XML files is required in order for this application to operate properly, you need to use Repackager to repackage this application. |

## Error -9051: Package Decompression Canceled

The following table documents this message:

**Table 39** ▪ Error -9051: Package Decompression Canceled

| Category        | Description                                                                 |
|-----------------|-----------------------------------------------------------------------------|
| <b>Type:</b>    | Error                                                                       |
| <b>Message:</b> | Package decompression canceled by the user                                  |
| <b>Cause:</b>   | The user cancelled the process of decompression of compressed MSI packages. |

## Error -9100: CreateInstance of Package Object Failed

The following table documents this message:

**Table 40** ▪ Error -9100: CreateInstance of Package Object Failed

| Category           | Description                                                                                                                                                            |

| <b>Message:</b>    | Unexpected error writing Citrix registry entries                                                                                                                       |
| <b>Cause:</b>      | Unexpected internal error.                                                                                                                                             |
| <b>Resolution:</b> | First check to see if the product was installed properly. Then, perform <a href="#">preliminary investigational steps</a> and contact InstallShield Technical Support. |

## Error -9113: Error Writing Citrix INI File Entries

The following table documents this message:

**Table 51** - Error -9113: Error Writing Citrix INI File Entries

| Category           | Description                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                       |
| <b>Message:</b>    | Unexpected error writing Citrix INI file entries                                                            |
| <b>Cause:</b>      | Unexpected internal error.                                                                                  |
| <b>Resolution:</b> | Perform <a href="#">preliminary investigational steps</a> and then contact InstallShield Technical Support. |

## Error -9114: Error Writing Citrix Shortcuts

The following table documents this message:

**Table 52** ▪ Error -9114: Error Writing Citrix Shortcuts

| Category           | Description                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                       |
| <b>Message:</b>    | Unexpected error writing Citrix shortcuts                                                                                   |
| <b>Cause:</b>      | A catastrophic error has occurred while writing shortcuts to the profile.                                                   |
| <b>Resolution:</b> | Verify that shortcuts point to a valid file. Try to narrow down issue by only keeping one shortcut and then try to rebuild. |

## Error -9115: Error Saving Citrix Profile

The following table documents this message:

**Table 53** ▪ Error -9115: Error Saving Citrix Profile

| Category           | Description                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                       |
| <b>Message:</b>    | Unexpected error saving Citrix profile                                                                      |
| <b>Cause:</b>      | A catastrophic error has occurred while saving the Citrix profile.                                          |
| <b>Resolution:</b> | Perform <a href="#">preliminary investigational steps</a> and then contact InstallShield Technical Support. |

## Error -9116: Error Creating Empty Citrix Profile

The following table documents this message:

**Table 54** ▪ Error -9116: Error Creating Empty Citrix Profile

| Category           | Description                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                       |
| <b>Message:</b>    | Unexpected error creating empty Citrix profile                                                              |
| <b>Cause:</b>      | InstallShield is unable to create a new internal instance of a Citrix profile.                              |
| <b>Resolution:</b> | Perform <a href="#">preliminary investigational steps</a> and then contact InstallShield Technical Support. |

## Error -9117: Error Creating Intermediate Folder

The following table documents this message:

**Table 55** ▪ Error -9117: Error Creating Intermediate Folder

| Category           | Description                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                         |
| <b>Message:</b>    | Unexpected error creating intermediate folder                                                                                                                 |
| <b>Cause:</b>      | InstallShield is unable to create the intermediate folder used for the build. This error could occur if the user does not have permission to write to C:\TMP. |
| <b>Resolution:</b> | Obtain write access to C:\TMP and then rebuild the profile.                                                                                                   |

## Error -9118: Error Initializing Citrix Profile

The following table documents this message:

**Table 56** ▪ Error -9118: Error Initializing Citrix Profile

| Category           | Description                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                        |
| <b>Message:</b>    | Unexpected error initializing Citrix profile.                                                |
| <b>Cause:</b>      | The initial values on the new profile could not be set.                                      |
| <b>Resolution:</b> | Check the package name, description, version, and security settings for any possible causes. |

## Error -9119: Error Creating Default Target in Citrix Profile

The following table documents this message:

**Table 57** ▪ Error -9119: Error Creating Default Target in Citrix Profile

| Category           | Description                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                       |
| <b>Message:</b>    | Unexpected error creating default target in Citrix profile                                                  |
| <b>Cause:</b>      | Initial target in the new profile could not be created.                                                     |
| <b>Resolution:</b> | Perform <a href="#">preliminary investigational steps</a> and then contact InstallShield Technical Support. |

## Error -9120: Error Deleting File From Profile

The following table documents this message:

**Table 58** ▪ Error -9120: Error Deleting File From Profile

| Category           | Description                                                                                                                                                                                                                                 |

| <b>Message:</b>    | Failed to copy file into Citrix profile. Error: 'Name' File: 'Name'                                                                                                                                                                                                                                                  |
| <b>Cause:</b>      | Specified file could not be copied into profile.                                                                                                                                                                                                                                                                     |
| <b>Resolution:</b> | Check to see if the file exists and if the user has access rights to the file.<br><br>Also, when this error occurred, you should have also received a return error code from Windows Installer. Look up that error code in the <a href="#">Windows Installer Help Library</a> to determine the cause of the problem. |

## Error -9122: Target Does Not Exist in Citrix Profile

The following table documents this message:

**Table 60** ▪ Error -9122: Target Does Not Exist in Citrix Profile

| Category     | Description |
|--------------|-------------|
| <b>Type:</b> | Warning     |

**Table 60** ▪ Error -9122: Target Does Not Exist in Citrix Profile

| Category           | Description                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Message:</b>    | The target for shortcut 'ShortcutName' does not exist in the Citrix profile. Excluding shortcut.                                    |
| <b>Cause:</b>      | Actual file that shortcut points to is not included in the package.                                                                 |
| <b>Resolution:</b> | Exclude the shortcut by clearing the selection on the Citrix Assistant <b>Profile Shortcuts</b> page, and then rebuild the profile. |

## Error -9124: No Shortcuts Created for this Profile

The following table documents this message:

**Table 61** ▪ Error -9124: No Shortcuts Created for this Profile

| Category           | Description                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                               |
| <b>Message:</b>    | No shortcuts were created for this profile                                                          |
| <b>Cause:</b>      | A Citrix profile must include at least one valid shortcut.                                          |
| <b>Resolution:</b> | Add a shortcut on the Citrix Assistant <b>Profile Shortcuts</b> page, and then rebuild the profile. |

## Error -9125: Error Writing Citrix File Type Associations

The following table documents this message:

**Table 62** ▪ Error -9125: Error Writing Citrix File Type Associations

| Category           | Description                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                       |
| <b>Message:</b>    | Unexpected error writing Citrix file type associations                                                      |
| <b>Cause:</b>      | Unable to write file type associations.                                                                     |
| <b>Resolution:</b> | Perform <a href="#">preliminary investigational steps</a> and then contact InstallShield Technical Support. |

## Error -9126: Failed to Sign Profile Using Certificate

The following table documents this message:

**Table 63** ▪ Error -9126: Failed to Sign Profile Using Certificate

| Category           | Description                                               |
|--------------------|-----------------------------------------------------------|
| <b>Type:</b>       | Error                                                     |
| <b>Message:</b>    | Failed to sign the profile using the supplied certificate |
| <b>Cause:</b>      | The certificate that is being used is invalid.            |
| <b>Resolution:</b> | Obtain a valid certificate and rebuild the profile.       |

## Error -9127: Could Not Create Script Execution

The following table documents this message:

**Table 64** ▪ Error -9127: Could Not Create Script Execution

| Category           | Description                                                                                                                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                                                                                             |
| <b>Message:</b>    | Could not create script execution for 'ScriptName'                                                                                                                                                                                                                                                |
| <b>Cause:</b>      | The specified script contains invalid data.                                                                                                                                                                                                                                                       |
| <b>Resolution:</b> | <p>On the Citrix Assistant <b>Build Settings</b> page, delete the script from the profile, re-add it, and then rebuild the profile.</p> <p>If you are still having problems, perform these additional <a href="#">investigational steps</a> and then contact InstallShield Technical Support.</p> |

## Warning -9128: Duplicate Shortcut

The following table documents this message:

**Table 65** ▪ Warning -9128: Duplicate Shortcut

| Category        | Description                                                                          |
|-----------------|--------------------------------------------------------------------------------------|
| <b>Type:</b>    | Warning                                                                              |
| <b>Message:</b> | 'ShortcutName' shortcut already exists in the profile. Excluding duplicate shortcut. |

**Table 65** ▪ Warning -9128: Duplicate Shortcut

| Category           | Description                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>      | There are multiple shortcuts defined in this profile that refer to different Start Menu locations or to other locations in the package.        |
| <b>Resolution:</b> | These shortcuts are not needed. On the Citrix Assistant <b>Profile Shortcuts</b> page, unselect these shortcuts, and then rebuild the profile. |

## Warning -9129: Duplicate Shortcut Names

The following table documents this message:

**Table 66** ▪ Warning -9129: Duplicate Shortcut Names

| Category           | Description                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                                                       |
| <b>Message:</b>    | 'ShortcutName' shortcut already exists in the profile, but with different command line parameters. A new unique shortcut 'NewShortcutName(1)' will be created in the profile. |
| <b>Cause:</b>      | There are two shortcuts defined in this profile that have the same name, even though they have different command line parameters.                                             |
| <b>Resolution:</b> | On the Citrix Assistant <b>Profile Shortcuts</b> page, rename one of these shortcuts and then rebuild the profile.                                                            |

## Warning -9130: Duplicate Shortcut Targets

The following table documents this message:

**Table 67** ▪ Warning -9130: Duplicate Shortcut Targets

| Category           | Description                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                                      |
| <b>Message:</b>    | 'ShortcutName' shortcut already exists in the profile, but with different target. A new unique shortcut 'NewShortcutName(1)' will be created in the profile. |
| <b>Cause:</b>      | There are two shortcuts defined in this profile that have the same name, even though they have different targets.                                            |
| <b>Resolution:</b> | On the Citrix Assistant <b>Profile Shortcuts</b> page, rename one of these shortcuts and then rebuild the profile.                                           |

## Warning -9131: Unable to Resolve Installer Variable

The following table documents this message:

**Table 68** • Warning -9131: Unable to Resolve Installer Variable

| Category           | Description                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                     |
| <b>Message:</b>    | Unable to resolve an installer variable in the string 'StringName'                                                                          |
| <b>Cause:</b>      | Not all Windows Installer variables can be resolved at build time. This can result in errors if your application requires a specific value. |
| <b>Resolution:</b> | Repackage this application and rebuild the profile, or use a constant value in the Windows Installer package.                               |

## Warning -9132: 16 Color Shortcut Icon Not Found

The following table documents this message:

**Table 69** • Warning -9132: 16 Color Shortcut Icon Not Found

| Category           | Description                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                                                                                                   |
| <b>Message:</b>    | No 16 color icon found for 'ShortcutName' shortcut. Shortcut icon may look distorted when published.                                                                                                                      |
| <b>Cause:</b>      | The icon used for this shortcut does not contain a 16-color image. Since Citrix currently does not support images with a higher number of colors, this icon may look distorted when shown and published in Citrix XenApp. |
| <b>Resolution:</b> | You can modify the shortcut to use a different icon or add a 16-color image to the one currently used.                                                                                                                    |

## Warning -9133: Shortcut Icon Not Found

The following table documents this message:

**Table 70** • Warning -9133: Shortcut Icon Not Found

| Category     | Description |
|--------------|-------------|
| <b>Type:</b> | Warning     |

**Table 70** ▪ Warning -9133: Shortcut Icon Not Found

| Category           | Description                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Message:</b>    | No icon found for 'ShortcutName' shortcut. Using generic Windows application icon instead.                                                                                               |
| <b>Cause:</b>      | If no icon can be loaded for this shortcut, the generic Windows application icon is used. This can happen if the file used is corrupt or if extracting an image from it is not possible. |
| <b>Resolution:</b> | Modify the shortcut to use a different icon.                                                                                                                                             |

## Warning -9134: Failure to Extract Icon from Executable

The following table documents this message:

**Table 71** ▪ Warning -9134: Failure to Extract Icon from Executable

| Category           | Description                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                     |
| <b>Message:</b>    | Failed to extract icon from executable 'filename'. Make sure the executable is not corrupt. |
| <b>Cause:</b>      | A corrupt icon file may cause this warning.                                                 |
| <b>Resolution:</b> | Modify the shortcut to use a different icon.                                                |

## Error -9135: Shortcut Target is 16-Bit

The following table documents this message:

**Table 72** ▪ Error -9135: Shortcut Target is 16-Bit

| Category           | Description                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                             |
| <b>Message:</b>    | The target for shortcut 'ShortcutName' is 16-bit. This application may not function properly in the Citrix Isolation Environment. |
| <b>Cause:</b>      | The file this shortcut points to is a 16-bit application.                                                                         |
| <b>Resolution:</b> | Replace file with a newer 32-bit version. Can also test and see if the application works properly in the Citrix environment.      |

## Warning -9136: Some Files May Not Be Decompressed

The following table documents this message:

**Table 73** • Warning -9136: Some Files May Not Be Decompressed

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Message:</b>    | Some files may not be decompressed from this package because it contains features with a default install level of 0.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Cause:</b>      | When installing a compressed Windows Installer package, the build engine runs an administrative installation of it to decompress it. One limitation of an administrative installation is that it does not decompress a file if the feature it is contained in has a default install level of 0. If there are any files in any components contained within those features, InstallShield will generate an error when it attempts to copy those files into the Citrix profile, because they will not exist in the source location. |
| <b>Resolution:</b> | To resolve this issue, edit the Windows Installer package and set the default install level of that feature to something other than 0.                                                                                                                                                                                                                                                                                                                                                                                           |

## Warning -9137: Destination Directory Cannot Be Found

The following table documents this message:

**Table 74** • Warning -9137: Destination Directory Cannot Be Found

| Category           | Description                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                                            |
| <b>Message:</b>    | The destination directory for the 'FileName' file cannot be found. You should consider Repackaging this application before proceeding with the conversion process. |
| <b>Cause:</b>      | This is an internal error.                                                                                                                                         |
| <b>Resolution:</b> | Contact InstallShield Technical Support.                                                                                                                           |

## Warning -9138: Ignoring a DuplicateFile Table Entry

The following table documents this message:

**Table 75** • Warning -9138: Ignoring a DuplicateFile Table Entry

| Category           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Type:</b>       | Warning                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Message:</b>    | Ignoring a DuplicateFile table entry because unable to resolve the property used for the DestFolder: 'INVALIDPATH'                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Cause:</b>      | You might encounter this error when the Windows Installer package that you are converting includes one or more entries in the DuplicateFile table, and a property that is used in the DestFolder column for one of those entries in the DuplicateFile table cannot be resolved. For example, if the destination for a duplicate file is set by a custom action, that destination cannot be resolved during the conversion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Resolution:</b> | <p>The <b>DuplicateFile</b> table contains a list of files that need to be duplicated during installation, either to a different directory than the original file or to the same directory but with a different name. Because a destination in this table cannot be resolved, you need to do one of the following to resolve this issue:</p> <ul style="list-style-type: none"><li>● <b>Option 1: Edit the Windows Installer Package</b>—Open the Windows Installer package in InstallShield and modify it to eliminate the use of the problematic entry in the <b>DuplicateFile</b> table by including any additional copies of that file.</li><li>● <b>Option 2: Repackage the Application</b>—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package.</li><li>● <b>Option 3: Write a Pre-Launch Script</b>—Write a pre-launch script that—upon application launch—performs the file copy operations for the problematic entry in the <b>DuplicateFile</b> table.</li></ul> |

## Warning -9150: Warning Building Windows Installer Package

The following table documents this message:

**Table 76** • Warning -9150: Warning Building Windows Installer Package

| Category        | Description                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>    | Warning                                                                                                                                                                     |
| <b>Message:</b> | Warning building Windows Installer package: <i>Warning number and message.</i>                                                                                              |
| <b>Cause:</b>   | This warning indicates that InstallShield encountered a build warning when it built the new Basic MSI project and releases for the App-V application that you are creating. |

**Table 76** ▪ Warning -9150: Warning Building Windows Installer Package (cont.)

| Category           | Description                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resolution:</b> | You may need to resolve the warning in the Basic MSI project that InstallShield created in the App-VPackage subfolder when you built the App-V application. However, note that InstallShield overwrites the Basic MSI project each time that you rebuild the App-V application. |

## Error -9151: Error Building Windows Installer Package

The following table documents this message:

**Table 77** ▪ Error -9150: Error Building Windows Installer Package

| Category           | Description                                                                                                                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                                                                         |
| <b>Message:</b>    | Error building Windows Installer package: <i>Error number and message.</i>                                                                                                                                                                                                    |
| <b>Cause:</b>      | This error indicates that InstallShield encountered a build error when it built the new Basic MSI project and releases for the App-V application that you are creating.                                                                                                       |
| <b>Resolution:</b> | You may need to resolve the error in the Basic MSI project that InstallShield created in the App-VPackage subfolder when you built the App-V application. However, note that InstallShield overwrites the Basic MSI project each time that you rebuild the App-V application. |

## Error -9200: ThinApp Must Be Installed

The following table documents this message:

**Table 78** ▪ Error -9200: ThinApp Must Be Installed

| Category           | Description                                                                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                               |
| <b>Message:</b>    | A licensed or demo version of ThinApp must be installed on this machine in order to successfully build ThinApp applications. ( <a href="http://www.vmware.com">www.vmware.com</a> ) |
| <b>Cause:</b>      | ThinApp is not installed.                                                                                                                                                           |
| <b>Resolution:</b> | Install ThinApp.                                                                                                                                                                    |

## Warning -9201: Extension for Shortcut Files Must Be “.exe”

The following table documents this message:

**Table 79** ▪ Warning -9201: Extension for Shortcut Files Must Be “.exe”

| Category           | Description                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                     |
| <b>Message:</b>    | The extension for the target for shortcut 'ShortcutName' is not '.exe'. Excluding shortcut. |
| <b>Cause:</b>      | Shortcuts that do not have a filename extension of .exe are excluded.                       |
| <b>Resolution:</b> | No action is required.                                                                      |

## Error -9202: No Applications Were Created

The following table documents this message:

**Table 80** ▪ Error -9202: No Applications Were Created

| Category           | Description                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                               |
| <b>Message:</b>    | No applications were created.                                                                       |
| <b>Cause:</b>      | Either the Windows Installer package had no shortcuts or all shortcuts were excluded.               |
| <b>Resolution:</b> | Make sure that the source Windows Installer .msi package has at least one shortcut to an .exe file. |

## Error -9203: ThinApp Tool is Missing

The following table documents this message:

**Table 81** ▪ Error -9203: ThinApp Tool is Missing

| Category           | Description                                                                     |
|--------------------|---------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                           |
| <b>Message:</b>    | ThinApp: 'ToolName' was not found                                               |
| <b>Cause:</b>      | One of the ThinApp tools required to build a ThinApp application was not found. |
| <b>Resolution:</b> | Reinstall ThinApp.                                                              |

## Error -9204: Duplicate Shortcut

The following table documents this message:

**Table 82** ▪ Error -9204: Duplicate Shortcut

| Category           | Description                                                                   |
|--------------------|-------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                       |
| <b>Message:</b>    | 'ShortcutName' shortcut already exists. Excluding duplicate shortcut.         |
| <b>Cause:</b>      | The source package has two shortcuts that both point to the same .exe target. |
| <b>Resolution:</b> | No action is required.                                                        |

## Error -9205: Identically Named Shortcut Already Exists, But With Different Parameters

The following table documents this message:

**Table 83** ▪ Error -9205: Identically Named Shortcut Already Exists, But With Different Command Line Parameters

| Category           | Description                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                     |
| <b>Message:</b>    | 'ShortcutName' shortcut already exists, but with different command line parameters. A new, unique shortcut will be created. |
| <b>Cause:</b>      | Two shortcuts in the package differed in arguments only.                                                                    |
| <b>Resolution:</b> | No action is required.                                                                                                      |

## Error -9206: Identically Named Shortcut Already Exists, But With a Different Target

The following table documents this message:

**Table 84** ▪ Error -9206: Identically Named Shortcut Already Exists, But With a Different Target

| Category        | Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>    | Warning                                                                                                      |
| <b>Message:</b> | 'ShortcutName' shortcut already exists, but with a different target. A new, unique shortcut will be created. |
| <b>Cause:</b>   | Two shortcuts differed in the target pointed to only.                                                        |

The following table documents this message:

**Table 105** ▪ Error -9411: OSD File Template Could Not Be Extracted

| Category           | Description                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                            |
| <b>Message:</b>    | The Microsoft App-V OSD file template could not be extracted. The OSD file generation will not operate properly. |
| <b>Resolution:</b> | Contact InstallShield Technical Support.                                                                         |

## Error -9412: OSD File Could Not Be Saved

The following table documents this message:

**Table 106** ▪ Error -9412: OSD File Could Not Be Saved

| Category           | Description                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                               |
| <b>Message:</b>    | The Microsoft App-V OSD file could not be saved. The OSD file generation will not operate properly. |
| <b>Resolution:</b> | Contact InstallShield Technical Support.                                                            |

## Error -9413: App-V OSD Save

The following table documents this message:

**Table 107** ▪ Error -4313: App-V OSD Save

| Category           | Description                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                               |
| <b>Message:</b>    | The Microsoft App-V OSD file could not be saved. The OSD file generation will not operate properly. |
| <b>Resolution:</b> | Contact InstallShield Technical Support.                                                            |

## Warning -9414: Local App-V Application Specified as a Dependency of the Primary Application

The following table documents this message:

**Table 108** ▪ Warning -9414: Local App-V Application Specified as a Dependency of the Primary Application

| Category           | Description                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                                                                                                   |
| <b>Message:</b>    | A local App-V application was specified as a dependency of the primary application. The primary application may not run correctly if it is relocated to a different location.                                             |
| <b>Cause:</b>      | The user specified a dependent App-V application that is either on the local drive or on a mapped drive. This is determined by examining the HREF attribute of the CODEBASE tag in the dependency application's OSD file. |
| <b>Resolution:</b> | Dependency applications should be referenced by a portable mechanism using either a non-FILE protocol or by using a network URL.                                                                                          |

## Error -9415: Dependency Application Was Not Found

The following table documents this message:

**Table 109** ▪ Error -9415: Dependency Application Was Not Found

| Category           | Description                                                   |
|--------------------|---------------------------------------------------------------|
| <b>Type:</b>       | Error                                                         |
| <b>Message:</b>    | Dependency application was not found: 'ApplicationName'.      |
| <b>Cause:</b>      | A specified App-V dependency application file was not found.  |
| <b>Resolution:</b> | Check the path of the specified App-V dependency application. |

## Warning -9416: Invalid Primary Application Directory

The following table documents this message:

**Table 110** ▪ Warning -9416: Invalid Primary Application Directory

| Category        | Description                                                                   |
|-----------------|-------------------------------------------------------------------------------|
| <b>Type:</b>    | Error                                                                         |
| <b>Message:</b> | The specified Primary Application Directory, 'DirectoryName', does not exist. |

**Table 110** ▪ Warning -9416: Invalid Primary Application Directory

| Category           | Description                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>      | This may be caused if the directories specified in the Windows Installer package have changed after a valid Primary Application Directory was specified. |
| <b>Resolution:</b> | Specify a valid Primary Application Directory using the supplied browse folder in InstallShield.                                                         |

## Error -9417: Dependency Application's OSD File Contains an Invalid HREF Value

The following table documents this message:

**Table 111** ▪ Error -9417: Dependency Application's OSD File Contains an Invalid HREF Value

| Category           | Description                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                |
| <b>Message:</b>    | Dependency application OSD file contains an invalid value for the HREF field of the CODEBASE tag: 'HREF_Field_Value' |
| <b>Cause:</b>      | The CODEBASE tag of the dependency application's OSD file may have an empty or non-existent HREF attribute.          |
| <b>Resolution:</b> | Make sure that the CODEBASE tag of the dependency application's OSD file has a valid HREF attribute.                 |

## Error -9418: Error While Privatizing Side-By-Side Assemblies

The following table documents this message:

**Table 112** ▪ Error -9418: Error While Privatizing Side-By-Side Assemblies

| Category           | Description                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                     |
| <b>Message:</b>    | An error occurred while privatizing Side-By-Side assemblies.                                                                                                                                                              |
| <b>Cause:</b>      | When converting to an App-V package, files installed to the win32 Sxs assembly cache need to be privatized so that the App-V runtime can find them. This error occurs if there was an unexpected failure in that process. |
| <b>Resolution:</b> | Contact InstallShield Technical Support.                                                                                                                                                                                  |

## Error -9419: Error Inserting Watermark

The following table documents this message:

**Table 113** ▪ Error -9419: Error Inserting Watermark

| Category           | Description                                                                      |
|--------------------|----------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                            |
| <b>Message:</b>    | An error has occurred inserting the evaluation watermark into the App-V Package. |
| <b>Resolution:</b> | Contact InstallShield Technical Support.                                         |

## Error -9424: Building an App-V 5.x Package

The following table documents this message:

**Table 114** ▪ Error -9424: Building an App-V 5.x Package

| Category           | Description                                                                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                                                                                  |
| <b>Message:</b>    | Skipping conversion to Microsoft App-V 5. The minimum operating system requirement for building App-V 5 packages is Windows 8 or Windows Server 2012.                                                                  |
| <b>Resolution:</b> | Although you can configure settings for an App-V 5.x package on any version of Windows that InstallShield supports, building an App-V 5.x package from within InstallShield requires Windows 8 or Windows Server 2012. |

## Warning -9500: Shortcut Missing

The following table documents this message:

**Table 115** ▪ Warning -9500: Shortcut Missing

| Category           | Description                                                            |
|--------------------|------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                |
| <b>Message:</b>    | The target for shortcut 'FileName' does not exist. Excluding shortcut. |
| <b>Cause:</b>      | The target file of a shortcut in the project does not exist.           |
| <b>Resolution:</b> | Repackage this application and then rebuild the virtual package.       |

## Error -10000: Process Cancelled By User

The following table documents this message:

**Table 116** ▪ Error -10000: Process Cancelled By User

| Category        | Description                                                          |
|-----------------|----------------------------------------------------------------------|
| <b>Type:</b>    | Error                                                                |
| <b>Message:</b> | Process cancelled by user.                                           |
| <b>Cause:</b>   | User clicked <b>Cancel</b> to cancel the profile conversion process. |

## Warning -10001: Suite File Missing

The following table documents this message:

**Table 117** ▪ Warning -10001: Suite File Missing

| Category           | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                            |
| <b>Message:</b>    | The suite MSI file 'FileName' is missing and will be excluded from the conversion. |
| <b>Cause:</b>      | An MSI file that is part of a suite conversion was not found.                      |
| <b>Resolution:</b> | Make sure the input file for the suite conversion process exists.                  |

## Warning -10002: Suite File is Duplicate

The following table documents this message:

**Table 118** ▪ Warning -10002: Suite File is Duplicate

| Category           | Description                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Warning                                                                                                                                                  |
| <b>Message:</b>    | The suite MSI file 'FileName' appears to be the same as the main MSI file and we will exclude this file from the conversion process.                     |
| <b>Cause:</b>      | A suite conversion was attempted where the main Windows Installer file (.msi) and one of the additional Windows Installer files specified were the same. |
| <b>Resolution:</b> | Specify unique Windows Installer files as part of the suite conversion process.                                                                          |

## Warning -10003: Application File Missing

The following table documents this message:

**Table 119** ▪ Warning -10003: Application File Missing

| Category           | Description                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Error                                                                                                                                                   |
| <b>Message:</b>    | Application file not found 'ApplicationName'                                                                                                            |
| <b>Cause:</b>      | A file referenced by the installation was not found by the App-V virtual converter. It is likely that the file reference is broken in the installation. |
| <b>Resolution:</b> | Use InstallShield to locate the file in the installation and either fix the link or delete it.                                                          |

## Warning -10004: INI File Missing

The following table documents this message:

**Table 120** ▪ Warning: -10004: INI File Missing

| Category           | Description                              |
|--------------------|------------------------------------------|
| <b>Type:</b>       | Error                                    |
| <b>Message:</b>    | INI file not found 'INI_File_Name'.      |
| <b>Resolution:</b> | Contact InstallShield Technical Support. |

## Fix 11000: Excluding TCPIP Registry Entries

The following table documents this message:

**Table 121** ▪ Fix 11000: Excluding TCPIP Registry Entries

| Category        | Description                                                          |
|-----------------|----------------------------------------------------------------------|
| <b>Type:</b>    | Fix                                                                  |
| <b>Message:</b> | Excluding TCPIP registry entries from the Citrix profile.            |
| <b>Action:</b>  | All TCPIP registry entries will be excluded from the Citrix profile. |

## Fatal Error 11001: Fail on VMware

The following table documents this message:

**Table 122** ▪ Fatal Error 11001: Fail on VMware

| Category        | Description                                                            |
|-----------------|------------------------------------------------------------------------|
| <b>Type:</b>    | Fatal                                                                  |
| <b>Message:</b> | VMware cannot be virtualized.                                          |
| <b>Cause:</b>   | Conversion will fail when the application being virtualized is VMware. |
| <b>Action:</b>  | This error message is displayed: VMware cannot be virtualized.         |

## Warning 11003: Control Panel Applet - Citrix

The following table documents this message:

**Table 123** ▪ Warning 11003: Control Panel Applet - Citrix

| Category        | Description                                                                  |
|-----------------|------------------------------------------------------------------------------|
| <b>Type:</b>    | Warning                                                                      |
| <b>Message:</b> | The Control Panel Applet [AppletName] will not appear in Control Panel.      |
| <b>Action:</b>  | A warning is displayed when the application contains a Control Panel applet. |

## Fix 11004: Control Panel Applet - ThinApp

The following table documents this message:

**Table 124** ▪ Fix 11004: Control Panel Applet - ThinApp

| Category        | Description                                                                 |
|-----------------|-----------------------------------------------------------------------------|
| <b>Type:</b>    | Fix                                                                         |
| <b>Message:</b> | Generating shortcut for the Control Panel Applet located at 'DirectoryPath' |
| <b>Action:</b>  | A default shortcut is created for ThinApp Control Panel applets.            |

## Fatal Error 11005: QuickTime 7.4.1 Causes Fatal Error

The following table documents this message:

**Table 125** ▪ Error 11005: QuickTime 7.4.1 Causes Fatal Error

| Category           | Description                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Type:</b>       | Fatal Error                                                                                               |
| <b>Message:</b>    | QuickTime 7.4.1 is known to have errors when running from a virtual package. Use QuickTime 7.4.5 instead. |
| <b>Cause:</b>      | QuickTime 7.4.1 cannot be virtualized correctly.                                                          |
| <b>Resolution:</b> | Obtain QuickTime 7.4.5 and repeat the conversion process.                                                 |

## Fix 11006: Adobe Distiller Exclude AdobePDFSettings

The following table documents this message:

**Table 126** ▪ Fix 11006: Adobe Distiller Exclude AdobePDFSettings

| Category        | Description                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type:</b>    | Fix                                                                                                                                      |
| <b>Message:</b> | Excluding the registry key Software\Adobe\Acrobat Distiller\AdobePDFSettings. Adobe Distiller will recreate these settings on first use. |
| <b>Action:</b>  | The AdobePDFSettings registry settings are excluded.                                                                                     |

## Fix 11007: Exclude URL Shortcut

The following table documents this message:

**Table 127** ▪ Fix 11007: Adobe Distiller Exclude AdobePDFSettings

| Category        | Description                                                                  |
|-----------------|------------------------------------------------------------------------------|
| <b>Type:</b>    | Fix                                                                          |
| <b>Message:</b> | Excluding shortcut to .URL file. App-V does not launch these files properly. |
| <b>Action:</b>  | The shortcut to the .URL file is excluded.                                   |

## Steps to Take Before Calling Technical Support

Before contacting InstallShield Technical Support, perform the following steps to attempt to clearly identify the problem you are having:

- **Check package**—To determine if this error is caused by a problem with the specific package you are converting, try to build a Citrix profile of a simple package that contains only one file.
- **Check machine and OS**—To determine if this error is caused by a configuration on a particular machine or operating system, attempt to build this Citrix profile on another machine or operating system.
- **Check individual files**—To determine if this is error limited to a specific item, find out if removing or excluding a particular item will build error free.

## Application Features Requiring Pre- or Post-Conversion Actions

Some application features are ignored when creating a Citrix profile. Therefore, some additional pre- or post-conversion actions must be taken in order for the virtual application to work.

The following table lists the application features which require additional, manual conversion steps:

**Table 128** ▪ Application Features Ignored During Profile Conversion

| Windows Installer Feature          | Manual Conversion Steps                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User-Defined Custom Actions</b> | <p>When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. For user-defined custom actions, a warning message is generated. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile.</p> <p>The resolution that you should perform depends upon the purpose of the custom action:</p> <ul style="list-style-type: none"><li>● If the custom action merely automatically enters a value or makes some other kind of minor modification, you can ignore this warning.</li><li>● If the custom action does something which could change the behavior of the installation (such as setting a Property), you may need to resolve this issue.</li></ul> <p>To resolve this issue, first attempt to launch the converted package on Citrix XenApp. If you receive any application errors, you need to repackage this application, by performing the following steps.</p>  <hr/> <p><b>To successfully convert a package with user-defined custom actions:</b></p> <ol style="list-style-type: none"><li>1. Use the Repackaging Wizard to repackage this application. The Repackaging Wizard monitors system changes as an application is installed, and then that data is converted into a Repackager project.</li><li>2. Build the Repackager project to generate a revised Windows Installer package. This new Windows Installer package does not contain any custom actions, but (as a result of being repackaged) it will include the functionality performed by the original custom action.</li></ol> <hr/> |
| <b>Services</b>                    | <p>Citrix XenApp does not support any type of services. Therefore, to resolve this issue, you need to install any required services outside of the isolation environment on the user desktop machines.</p>  <hr/> <p><b>To successfully convert a package with services:</b></p> <ol style="list-style-type: none"><li>1. If you have an application and a service bundled in the same Windows Installer package, you need to create a separate Windows Installer package containing just the service.</li><li>2. Install the service on each of the user desktop machines. The Citrix profile of this application should now be able to run in an isolation environment on machines that already have the service installed.</li></ol> <hr/>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 128** ▪ Application Features Ignored During Profile Conversion

| Windows Installer Feature | Manual Conversion Steps                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COM+                      | While Citrix XenApp supports communicating with COM+ applications, it does not support <i>installing</i> COM+ services. Therefore, an application that contains COM+ services cannot be deployed on Citrix XenApp. |

# Automation Interface

The InstallShield Help Library explains how to use the InstallShield interface to author all elements of your installation and then build a release. For advanced developers, InstallShield exposes a COM interface that allows you to perform many of the same tasks from a program, such as a Visual Basic executable, or a script, such as a VBScript file in Windows Scripting Host. By calling methods, setting properties, accessing collections, and so on, through the automation interface, you can open a project and modify its features and component data in many of the same ways that you would in the InstallShield interface.

The highest-level object in the automation interface is the `ISWiProject` object. The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.

---

**Note** ▪ The automation interface affects a project only at design time and not run time.

For information on automation interface support in Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, and Merge Module projects, see the following sections:

- [Automation Objects](#)
- [Automation Collections](#)

For information on automation interface support in Advanced UI and Suite/Advanced UI projects, see the following sections:

- [Automation Objects for Advanced UI and Suite/Advanced UI Projects](#)
- [Automation Collections for Advanced UI and Suite/Advanced UI Projects](#)

## Automation Objects

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Each InstallShield automation object represents an installation element such as a feature, a component, or a file. This section describes each of the InstallShield automation objects.

The highest-level object in the automation interface is the `ISWiProject` object. The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.

---

**Note** ▪ The examples provided in the Automation Objects subsections use Visual Basic sample code, not VBScript.

## ISWiProject Object

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.

**Note** - The examples provided in the Automation Objects subsections use Visual Basic sample code, not VBScript.

ISWiProject contains the interface for opening, closing, and saving an InstallShield project file (.ism or .dim). When InstallShield is installed on your system, you can instantiate a copy of ISWiProject with the following VB and VBScript syntax:

```
Set m_ISWiProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
```

To open an installation project, call the OpenProject method, as follows:

```
' Build path to the .ism file
strFile = "C:\InstallShield 2021 Projects\Test.ism"
m_ISWiProject.OpenProject strFile
```

**Important** - If you are using the automation interface on a 64-bit machine, you may need to load the automation interface through a 32-bit executable file. Otherwise, you may encounter an error when you instantiate a copy of ISWiProject, or any other object. For more information, see [Using the Automation Interface on a 64-Bit System](#).

### Build Status Events

The ISWiProject object raises the following status events:

- Public Event ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
- Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
- Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)

These events are raised during the build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see [Using Build Status Events](#).

Many feature properties and attributes are available in the automation interface through this object's methods, properties, and collections. The following table lists the ISWiProject Object members. Remember that some methods, properties, and collections are only available for a particular project type.

## Members

**Table 1** • ISWiProject Object Members

| Name                            | Project                                                                                                      | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ActiveLanguage</b>           | Basic MSI,<br>DIM,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object                     | Read-Write<br>Property | Gets or sets the default language of the project. Specify a single language as a language ID.<br><br>The automation interface uses the default language whenever you get or set a localizable property, such as ISWiShortcut's DisplayName. In InstallShield, localizable properties must use a string entry. If the property has a string identifier, the string that you enter for the property becomes the string entry's value for the default language. |
| <b>AddAdvancedFile</b>          | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object                             | Method                 | Creates an advanced file with the specified name and (optionally) in the specified disk image in the current project.                                                                                                                                                                                                                                                                                                                                        |
| <b>AddAutomaticUpgradeEntry</b> | Basic MSI,<br>InstallScript<br>MSI                                                                           | Method                 | Creates a new ISWiAutomaticUpgradeEntry item and returns a handle to that object.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>AddChainPackage Method</b>   | Basic MSI,<br>InstallScript<br>MSI                                                                           | Method                 | Creates an <b>ISWiChainPackage Object</b> in the current project.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>AddComponent</b>             | Basic MSI,<br>DIM,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object,<br>Merge<br>Module | Method                 | Creates an <b>ISWiComponent</b> object in the current project.                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>ISWiFeatures</b>                | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object,<br>Merge<br>Module         | Collection | Contains all features' names and their components.                                                                                                  |
| <b>ISWiLanguages</b>               | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object,<br>Merge<br>Module         | Collection | Contains all of the languages included in the current project.                                                                                      |
| <b>ISWiPatchConfigs</b>            | Basic MSI,<br>InstallScript<br>MSI                                                                           | Collection | Contains all of the patch configurations in this project.                                                                                           |

**Table 1** • ISWiProject Object Members (cont.)

| Name                      | Project                                                                                              | Type       | Description                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------|------------|----------------------------------------------------------------------------------|
| <b>ISWiPathVariables</b>  | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object,<br>Merge<br>Module | Collection | Contains all of the path variables that are associated with the current project. |
| <b>ISWiProductConfigs</b> | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object,<br>Merge<br>Module | Collection | Contains all of the product configurations in this project.                      |
| <b>ISWiProperties</b>     | Basic MSI,<br>DIM,<br>InstallScript<br>MSI, Merge<br>Module                                          | Collection | Contains all of the Windows Installer properties in this project.                |
| <b>ISWiSetupFiles</b>     | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object                     | Collection | Contains every support file (as an ISWiSetupFile object) in your project.        |
| <b>ISWiSetupTypes</b>     | InstallScript,<br>InstallScript<br>Object                                                            | Collection | Contains every setup type (as an ISWiSetupType object) in your project.          |
| <b>ISWiSISProperties</b>  | Basic MSI,<br>DIM,<br>InstallScript<br>MSI, Merge<br>Module                                          | Collection | Contains all of the Summary Information Stream properties in this project.       |
| <b>ISWiSQLConnections</b> | Basic MSI,<br>DIM,<br>InstallScript,<br>InstallScript<br>MSI                                         | Collection | Contains all of the SQL Server connections in the current project.               |

**Table 1** • ISWiProject Object Members (cont.)

| Name                              | Project                                    | Type                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|--------------------------------------------|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ISWiUpgradeTableEntries</b>    | Basic MSI, InstallScript MSI               | Collection                   | Returns a collection of ISWiUpgradeTableEntry items. This collection presents a list of static major upgrade items, as defined in the IDE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>MergeModuleSearchPath</b>      | Basic MSI, InstallScript MSI               | Read-Write Property          | <p>Specifies one or more comma-delimited folders that contain the merge module (.msm) files referenced by your project.</p>  <p><b>Note</b> • If you plan to use the <i>ISWiRelease.Build</i> method, you should set this property.</p>                                                                                                                                                                                                                                                                                               |
| <b>MinimumTargetDotNetVersion</b> | Basic MSI, InstallScript MSI               | Read-Write Property          | Specifies the minimum version of the .NET Framework that the installation requires on the target system. This parameter is optional. The default is the latest version of the .NET Framework the InstallShield interface supports.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>MinimumTargetMSIVersion</b>    | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property          | Specifies the minimum version of Windows Installer that the installation requires on the target system. This parameter is optional. The default is the latest version of Windows Installer that the InstallShield interface supports.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ModuleID and ModuleIDGUID</b>  | Merge Module                               | Read-Write String Properties | <p>These properties are used only with merge module projects. Every merge module has a record in the ModuleSignature table. The ModuleID field of the ModuleSignature table is composed of two sections: ModuleID.ModuleIDGUID.</p> <p>For example, for a ModuleID value of IDID.019880FB_04F2_4D4B_99C9_9A0A12185229, the ModuleID and ModuleIDGUID properties of the ISWiProject object enable the following:</p> <ul style="list-style-type: none"> <li>• The ModuleID property gets or sets <i>IDID</i>.</li> <li>• The ModuleIDGUID property gets or sets <i>019880FB_04F2_4D4B_99C9_9A0A12185229</i>.</li> </ul> |

**Table 1** • ISWiProject Object Members (cont.)

| Name               | Project                                                                                                      | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>OnUpgrade</b>   | Basic MSI,<br>InstallScript<br>MSI                                                                           | Read-Write<br>Property | <p>Gets or sets the value for the Small/Minor/Upgrade Settings options on the Common tab in the Upgrades view. This property lets you specify whether you want end users to be prompted before proceeding with the upgrade. A Setup.exe setup launcher is required for this functionality. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>eouPrompt (1)</b>— Prompt.</li> <li>● <b>eouUpgrade (2)</b>—Do not prompt the end user; just install the upgrade.</li> <li>● <b>eouNoOp (0)</b>—Disable any prompts. Your installation should detect the upgrade scenario and run the installation in upgrade mode.</li> </ul> |
| <b>OpenProject</b> | Basic MSI,<br>DIM,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object,<br>Merge<br>Module | Method                 | <p>Opens an InstallShield installation project file (.ism or .dim).</p> <p>This method fails if the project is open in the InstallShield user interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## AddAdvancedFile Method

**Project** • The AddAdvancedFile method applies to the following project types.

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

The AddAdvancedFile method creates an **advanced file** object with the specified name and (optionally) in the specified disk image in the current project.

Syntax

AddAdvancedFile (FileName As String, Optional DiskType As ISWiDiskType = edtDisk1) As ISWiAdvancedFile

Parameters

Table 2 • AddAdvancedFile Method Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FileName  | Pass the fully qualified filename for the advanced file that you want to add.                                                                                                                                                                                                                                                                                                                                                                               |
| DiskType  | <p>This optional parameter specifies the Advanced Files folder in which you want to add the advanced file. Specify one of the following values.</p> <ul style="list-style-type: none"><li>edtDisk1 (1)—Add the advanced file to the Disk 1 folder. This is the default value for this optional parameter.</li><li>edtLastDisk (-1)—Add the advanced file to the Last Disk folder.</li><li>edtOther (0)—Add the advanced file to the Other folder.</li></ul> |

Example

The following Visual Basic lines demonstrate this method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

Set pAdvancedFile = pProj.AddAdvancedFile ("C:\My Files\MyLastDiskFile.ext", edtLastDisk)

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

AddAutomaticUpgradeEntry Method

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddAutomaticUpgradeEntry method to create a new IswiAutomaticUpgradeEntry item and return a handle to that object.

## Syntax

AddAutomaticUpgradeEntry()

## Example

The following Visual Basic lines demonstrate this method:

```
'#####
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'#####
set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-
21.ism")

'#####
'To create a new entry

dim pAutoEntry
set pAutoEntry = pProject.AddAutomaticUpgradeEntry()

pAutoEntry.Name ="AutoEntry"
pAutoEntry.ReleaseFlags = "AutoFlag"
pAutoEntry.UpgradeSetupPath = "AutoPath"

'#####
'To find and delete an existing entry

set pAutoEntry = nothing
set pAutoEntry = pProject.IswiAutoUpgradeEntries("AutoEntry")
pAutoEntry.Delete

pProject.SaveProject
pProject.CloseProject
```

## Applies To

- ISWiProject

## AddChainPackage Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddChainPackage method to create and add a chained .msi package to the current project.

Syntax

AddChainPackage (ChainPackageKey As String) As ISWiChainPackage

Parameters

Table 3 • AddChainPackage Method Parameter

| Parameter       | Description                                                       |
|-----------------|-------------------------------------------------------------------|
| ChainPackageKey | Name of the chained .msi package that you want to create and add. |

Applies To

- ISWiProject

AddComponent Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The AddComponent method creates a **component** object with the specified name in the current project.

When the component is added, a GUID is automatically generated for it (see the GUID property for **ISWiComponent**). After you have added the component, you can set its other properties and **associate it with a feature**.

### Syntax

AddComponent (ComponentKey As String) As ISWiComponent

### Parameters

**Table 4 •** AddComponent Method Parameters

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ComponentKey</b> | The component key is the same as the name of the component that is displayed in the Setup Design views. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. ComponentKey must be unique among your project's component names.<br><br>Component names are case-sensitive. |

### Example

The following Visual Basic lines demonstrate this method:

```
Dim pComponent As ISWiComponent
Set pComponent = m_pProject.AddComponent ("New_Component")
```

### Applies To

- ISWiProject

## AddCustomAction Method

**Project •** This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call the AddCustomAction method to add a custom action to the current project. To insert a custom action into a sequence, use the [InsertCustomAction](#) method.

Syntax

AddCustomAction (CustomActionKey As String) as ISWiCustomAction

Parameters

Table 5 • AddCustomAction Method Parameters

| Parameter       | Description                                              |
|-----------------|----------------------------------------------------------|
| CustomActionKey | The string name of the custom action you want to create. |

Applies To

- ISWiProject

AddFeature Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The AddFeature method creates a feature with the specified name. AddFeature is a member of [ISWiProject](#). The new feature is added to the current project as a top-level feature, but when this method is a member of an [ISWiFeature](#) object, the new feature is added as a subfeature of the current feature.

The feature is created with the same default properties that new features have when you add them in InstallShield.

After you have added the feature, you can set its other properties and associate components with it.

## Syntax

AddFeature (FeatureKey As String) As ISWiFeature

## Parameters

**Table 6 • AddFeature Method Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FeatureKey</b> | <p>The feature key is the same as the name of the feature that is displayed in the Setup Design and Features views. The name becomes the index for the new ISWiFeature object. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. FeatureKey must be unique among your project's feature names.</p> <p>Feature names are case-sensitive.</p> |

## Example

The following Visual Basic lines demonstrate calling AddFeature to add a feature, a subfeature, and then associate an existing component with the subfeature:

```
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.ism"

Dim pFeat1, pFeat2 As ISWiFeature
Dim sFeat1Name, sFeat2Name As String

sFeat1Name = "ParentFeature"
sFeat2Name = "SubFeature"

' Add the feature ParentFeature, then SubFeature under ParentFeature
Set pFeat1 = pProject.AddFeature(sFeat1Name)
Set pFeat2 = pFeat1.AddFeature(sFeat2Name)

Dim pComp
Dim sCompName As String

' Add the existing component NewComponent1 to SubFeature
sCompName = "NewComponent1"
Set pComp = pProject.ISWiComponents.Item(sCompName)
pFeat2.AttachComponent pComp

pProject.SaveProject
pProject.CloseProject
```

## Applies To

- ISWiProject
- ISWiFeature

## AddLanguage Method

**Edition** ▪ Support for multilanguage installations is available with InstallShield Premier Edition.

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the AddLanguage method to add a language to the current project. Using this method is similar to adding a language in the General Information view in InstallShield. You can set the properties of the new language with the `ISWiLanguage` object.

### Syntax

AddLanguage (LangId As String)

### Parameters

**Table 7** ▪ AddLanguage Method Parameters

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| LangId    | Pass the language ID (as a string) that you want to add to the current project. For example:<br><br><code>oProject.AddLanguage "1035"</code> |

### Applies To

- `ISWiProject`

## AddPatchConfig Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddPatchConfig method to add a patch configuration to your project. Using this method is similar to adding a patch configuration with the Patch Design view of the IDE. You can set the properties of the new patch configuration with the `ISWiPatchConfig` object.

## Syntax

AddPatchConfig (PatchConfigKey As String) As ISWiPatchConfig

## Parameters

**Table 8** • AddPatchCofig Method Parameters

| Parameter      | Description                                     |
|----------------|-------------------------------------------------|
| PatchConfigKey | Holds the name of your new patch configuration. |

## Applies To

- [ISWiProject](#)

## AddPathVariable Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the AddPathVariable method to add a path variable to your project. Using this method is similar to adding a path variable in the Path Variables view in InstallShield. You can set the properties of the new path variable with the [ISWiPathVariable](#) object.

**Important** ▪ Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see [Predefined Path Variables](#).

Syntax

AddPathVariable (sName As String) As ISWiPathVariable

Parameters

Table 9 ▪ AddPathVariable Method Parameters

| Parameter | Description                              |
|-----------|------------------------------------------|
| sName     | Specifies the name of the path variable. |

Applies To

- ISWiProject

AddProductConfig Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

Call the AddProductConfig method to add a product configuration to your project. Using this method is similar to adding a product configuration with the Release Wizard or the Releases view of the IDE. You can set the properties of the new product configuration with the [ISWiProductConfig](#) object.

Syntax

AddProductConfig (ProductConfigKey As String) As ISWiProductConfig

Parameters

Table 10 ▪ AddProductConfig Method Parameters

| Parameter        | Description                                       |
|------------------|---------------------------------------------------|
| ProductConfigKey | Holds the name of your new product configuration. |

Applies To

- ISWiProject

AddProperty Method

**Project** ▪ The AddProperty method applies to the following project types.

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

The AddProperty method creates a Windows Installer property with the specified name in the current project.

## Syntax

AddProperty (Name As String) As ISWiProperty

## Parameters

**Table 11** ▪ AddProperty Method Parameters

| Parameter   | Description                                                            |
|-------------|------------------------------------------------------------------------|
| <b>Name</b> | Pass the name for the Windows Installer property that you want to add. |

## Example

The following Visual Basic lines demonstrate the AddProperty method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

Dim pProperty As ISWiProperty
Set pProperty = pProj.AddProperty ("MYPROP")
pProperty.Value = "MyPropValue"

pProj.SaveProject
pProj.CloseProject
```

## Applies To

- *ISWiProject*

## AddSetupFile Method

**Project** ▪ The AddSetupFile method applies to the following project types.

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The AddSetupFile method creates a support file with the specified name in the current project.

Syntax

AddSetupFile (FileName As String) As ISWiSetupFile

Parameters

Table 12 - AddSetupFile Method Parameters

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| FileName  | Pass the fully qualified file name for the support file that you want to add. |

Example

The following Visual Basic lines demonstrate the AddSetupFile method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.AddSetupFile ("C:\My Files\MySupportFile.ext")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

AddSetupType Method

**Project** - This information applies to the following project types:

- InstallScript
- InstallScript Object

The AddSetupType method creates a setup type with the specified name in the current project.

## Syntax

AddSetupType (Name As String) As ISWiSetupType

## Parameters

**Table 13** • AddSetupType Method Parameters

| Parameter   | Description                                                                                                                                                                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b> | <p>Pass the name for the setup type that you want to add. The name should be the text that you want to use as the display name.</p> <p>The automation interface automatically generates a valid primary key for the new setup type based on the name that you specify for this parameter.</p> |

## Example

The following Visual Basic lines demonstrate the AddSetupType method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupType As ISWiSetupType

Set pSetupType = pProj.AddSetupType ("Client Setup - Save Space")

pProj.SaveProject
pProj.CloseProject
```

## Applies To

- [ISWiProject](#)

## AddSQLServerConnection Method

**Project** • This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

Call the AddSQLServerConnection method to add a new server connection to your project.

## Syntax

```
Function AddSQLServerConnection(strConnectionName As String) As ISWiSQLConnection
```

## Parameters

**Table 14** • AddSQLServerConnection Method Parameters

| Parameter      | Description                                                   |
|----------------|---------------------------------------------------------------|
| ConnectionName | Specify the name of the new connection you want to establish. |

## Return Values

This method returns ISWiSQLConnection object.

## Applies To

- ISWiProject

## AddUpgradeTableEntry Method

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddUpgradeTableEntry method to create a new ISWiUpgradeTableEntry item and return a handle to that object.

## Syntax

```
AddUpgradeTableEntry()
```

## Example

The following Visual Basic lines demonstrate this method:

```
'#####
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'#####
set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-
21.ism")

'#####
'To create a new entry

dim pTableEntry
set pTableEntry = pProject.AddUpgradeTableEntry()
```

```

pTableEntry.UpgradeCode="{12345678-1234-1234-1234-123456789012}"
pTableEntry.VersionMin = "1.0"
pTableEntry.VersionMax = "2.0"
pTableEntry.Language = "0"
pTableEntry.Remove = ""
pTableEntry.ActionProperty = "ACTIONPROP_AUTOMATION"
pTableEntry.Attributes = 5

'#####
'To find and delete an existing entry

set pTableEntry =pProject.IsWiUpgradeTableEntries("{12345678-1234-1234-1234-123456789012}")
pTableEntry.Delete

pProject.SaveProject
pProject.CloseProject

```

## Applies To

- ISWiProject

## BuildPatchConfiguration Method

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call BuildPatchConfiguration to build the patch configuration identified by the strPatchConfiguration parameter. This action has the same effect as right-clicking on a patch configuration in the Patch Design view and then selecting Build a Patch.

## Syntax

BuildPatchConfiguration (strPatchConfigName as string)

## Parameters

**Table 15** • BuildPatchConfiguration Method Parameters

| Parameter                 | Description                                     |
|---------------------------|-------------------------------------------------|
| <b>strPatchConfigName</b> | Enter the fully qualified path to your project. |

## Properties

**Table 16** • Properties Associated with BuildPatchConfiguration Method

| Property                       | Description                                                   |
|--------------------------------|---------------------------------------------------------------|
| <b>PatchConfigErrorCount</b>   | Include the error count associated with a particular build.   |
| <b>PatchConfigWarningCount</b> | Include the warning count associated with a particular build. |

## Example

The following Visual Basic lines demonstrate this method:

```
'Create the project object
dim pProject
set pProject = CreateObject("ISwiAutoAutomation Interface Version.ISwiProject")

'Call the OpenProject method
'#####
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'#####
'pProject.OpenProject("\Your project.ism")

pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-
21.ism")

'Call the OpenProject method
'#####
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PATCH CONFIGURATION NAME
'#####

pProject.BuildPatchConfiguration "Config1"

MsgBox "Patch Congifuration Config1 build with " & _
    pProject.PatchConfigErrorCount & " Errors and " & _
    pProject.PatchConfigWarningCount & " Warnings"
```

## Applies To

- ISWiProject

## BuildPCPFile Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The BuildPCPFile method builds a patch package (.msp) file based on the settings in a patch creation properties (.pcp) file.

You do not need to have a project open in order to create a patch.

### Syntax

BuildPCPFile (strPCPFile As String, strPatchFile As String, strLogFile As String, bCreateUpdateExe As Boolean) As Long

### Parameters

**Table 17** ▪ BuildPCPFile Method Parameters

| Parameter               | Description                                                                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>strPCPFile</b>       | Specify the fully qualified path to a .pcp file. You can create or modify a .pcp file through the Patch Design view.                                                                             |
| <b>strPatchFile</b>     | Specify the fully qualified path for the .msp file you want to create. Any existing file with this name is overwritten. The file cannot be created if the directory you provided does not exist. |
| <b>strLogFile</b>       | Specify the fully qualified path to the .log file that records this method's status and success in creating the patch package. If the file exists, the current status is appended to it.         |
| <b>bCreateUpdateExe</b> | Set this option to True to have the package wrapped in an executable that applies the patch.                                                                                                     |

### Return Values

BuildPCPFile() returns the result returned by the Windows Installer function UiCreatePatchPackage.

The BuildPCPFile method builds a patch package (.msp) file based on the settings in a patch creation properties (.pcp) file.

You do not need to have a project open in order to create a patch.

### Applies To

- ISWiProject

## CloseProject Method

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

To close the project file (.ism or .dim) that you opened with [OpenProject](#), call CloseProject.

### Syntax

CloseProject ()

### Return Values

CloseProject always returns 0.

### Applies To

- [ISWiProject](#)

## CreatePatch Method

---

**Caution** ▪ This method is deprecated for new development and has been replaced with the *BuildPCPFile* and *BuildPatchConfiguration* methods. To facilitate backward compatibility with existing build scripts, the *CreatePatch* method calls the *BuildPCPFile* method.

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

### Syntax

CreatePatch()

### Applies To

- [ISWiProject](#)

# CreateProject Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.

The CreateProject method creates a new InstallShield project file (.ism) for a Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, or Merge Module project; it create a new InstallShield DIM project file (.dim) for DIM projects.

## Syntax

CreateProject (strISWiProjectFile As String, ByVal projectType As ISWiProjectType)

## Parameters

Table 18 ▪ CreateProject Method Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| strISWiProjectFile | Enter the fully qualified path to the .ism or .dim file that you want to create. Include the full file name.                                                                                                                                                                                                                                                                                                                                                                                     |
| projectType        | Specify what type of project you want to create. Valid values are: <ul style="list-style-type: none"><li>• <b>eptMsi (1)</b>—Creates a Basic MSI project.</li><li>• <b>eptScript (-1)</b>—Creates an InstallScript MSI project.</li><li>• <b>eptPro (9)</b>—Creates an InstallScript project.</li><li>• <b>eptProObj (10)</b>—Creates an InstallScript Object project.</li><li>• <b>eptMsm (2)</b>—Creates a Merge Module project.</li><li>• <b>eptDim (15)</b>—Creates a DIM project.</li></ul> |

## Example

The following sample code creates a Basic MSI project called TestProject.ism.

```
Dim pProject As ISWiAutoAutomation Interface Version.ISWiProject
Set pProject = CreateObject("ISWiAutoAutomation Interface Version.ISWiProject")

Dim sProjectName As String
sProjectName = "C:\InstallShield 2021 Projects\TestProject.ism"
```

```
pProject.CreateProject sProjectName, eptMsi

pProject.OpenProject sProjectName, False

pProject.CloseProject
```

Applies To

- ISWiProject

DeleteAdvancedFile Method

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

The DeleteAdvancedFile method deletes the specified advanced file from the current project.

Syntax

```
DeleteAdvancedFile (pAdvancedFile As ISWiAdvancedFile) As Long
```

Parameters

Table 19 - DeleteAdvancedFile Method Parameters

| Parameter     | Description                                     |
|---------------|-------------------------------------------------|
| pAdvancedFile | Specify the advanced file object to be deleted. |

Example

The following Visual Basic lines demonstrate the DeleteAdvancedFile method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

Set pAdvancedFile = pProj.ISWiAdvancedFiles.Item(1)
pProj.DeleteAdvancedFile pAdvancedFile

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

## DeleteChainPackage Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the DeleteChainPackage method to delete a chained .msi package from the current project.

### Syntax

DeleteChainPackage (ChainPackage As ISWiChainPackage)

### Parameters

**Table 20** ▪ DeleteChainPackage Method Parameter

| Parameter    | Description                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------|
| ChainPackage | Pass the <a href="#">ISWiChainPackage Object</a> that you want to delete from the current project. |

### Applies To

- [ISWiProject](#)

## DeleteComponent Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call DeleteComponent to delete a component in the project. Similar to deleting a component in the Setup Design views, DeleteComponent both removes a component from its feature and permanently deletes it from the project.

Syntax

DeleteComponent (Component As ISWiComponent)

Parameters

Table 21 - DeleteComponent Method Parameters

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| Component | Specify the <a href="#">ISWiComponent</a> object that the method will delete. |

Example

You can use the following lines to delete all components that are associated with the feature FeatureName1:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

Dim pFeat As ISWiFeature
Dim pComp As ISWiComponent

Set pFeat = pProj.ISWiFeatures.Item("FeatureName1")

For Each pComp In pFeat.ISWiComponents
    pProj.DeleteComponent pComp
Next

pProj.SaveProject
pProj.CloseProject
```

Applies To

- [ISWiProject](#)

DeleteCustomAction Method

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call the DeleteCustomAction method to completely delete a custom action from the current project.

## Syntax

DeleteCustomAction (CustomAction As ISWiCustomAction)

## Parameters

**Table 22** ▪ DeleteCustomAction Method Parameters

| Parameter           | Description                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------|
| <b>CustomAction</b> | Pass the <a href="#">ISWiCustomAction</a> object you want to delete from the current project. |

## Applies To

- [ISWiProject](#)

## DeleteMergeModule Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the DeleteMergeModule method to completely delete a merge module from the current project.

## Syntax

DeleteMergeModule (FileName As String)

## Parameters

**Table 23** ▪ DeleteMergeModule Method Parameters

| Parameter       | Description                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------|
| <b>FileName</b> | Pass the fully qualified file name for the merge module (.msm) file that you want to delete from the project. |

## Applies To

- [ISWiProject Object](#)

## DeletePatchConfig Method

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

Call the DeletePatchConfig method to delete a patch configuration from your project. Using this method is similar to deleting a patch configuration in the Patch Design view of the IDE.

Syntax

DeletePatchConfig (PatchConfig As ISWiPatchConfig)

Parameters

Table 24 • DeletePatchConfig Method Parameters

| Parameter      | Description                                                       |
|----------------|-------------------------------------------------------------------|
| PatchConfigKey | Pass the name of the patch configuration that you want to delete. |

Applies To

- *ISWiProject*

DeletePathVariable Method

**Project** • This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

Call the DeletePathVariable method to delete a path variable from your project. Using this method is similar to deleting a path variable from the Path Variables view in InstallShield.

**Important** • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see [Predefined Path Variables](#).

## Syntax

DeletePathVariable (pPathVar ISWiPathVariable) As Long

## Parameters

**Table 25** ▪ DeletePathVariable Method Parameters

| Parameter | Description                                                                     |
|-----------|---------------------------------------------------------------------------------|
| pPathVar  | Pass the ISWiPathVariable object for the path variable that you want to delete. |

## Applies To

- ISWiProject

## DeleteProductConfig Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

Call the DeleteProductConfig method to delete a product configuration from your project. Using this method is similar to deleting a product configuration in the Releases view of the IDE.

## Syntax

DeleteProductConfig (ProductConfig As ISWiProductConfig)

## Parameters

**Table 26** ▪ DeleteProductConfig Method Parameters

| Parameter        | Description                                                         |
|------------------|---------------------------------------------------------------------|
| ProductConfigKey | Pass the name of the product configuration that you want to delete. |

## Applies To

- ISWiProject

## DeleteProperty Method

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

Call the DeleteProperty method to delete a property from the Property table. The function returns 0 if successful.

Syntax

Public Function DeleteProperty(ByVal pProperty As ISWiProperty) As Long

Parameters

Table 27 ▪ DeleteProperty Method Parameters

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| Property  | Pass the name of the property you want to delete. |

Example

```
Dim proj As IswiAutoAutomation Interface Version.ISWiProject
Set proj = New IswiAutoAutomation Interface Version.ISWiProject
proj.OpenProject "c:\mysetups\your project name-3.ism"
Dim pProp As IswiAutoAutomation Interface Version.ISWiProperty
Set pProp = proj.ISWiProperties.Item("MyProperty")
proj.DeleteProperty pProp
```

Applies To

- *ISWiProject*

DeleteSetupFile Method

**Project ▪** The DeleteSetupFile method applies to the following project types.

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The DeleteSetupFile method deletes the specified support file from the current project.

## Syntax

DeleteSetupFile (pSetupFile As ISWiSetupFile) As Long

## Parameters

**Table 28** • DeleteSetupFile Method Parameters

| Parameter  | Description                            |
|------------|----------------------------------------|
| pSetupFile | The support file object to be deleted. |

## Example

The following Visual Basic lines demonstrate the DeleteSetupFile method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.ISWiSetupFiles.Item("MySupportFile.abc")
pProj.DeleteSetupFile pSetupFile

pProj.SaveProject
pProj.CloseProject
```

## Applies To

- ISWiProject

## DeleteSetupType Method

**Project** • This information applies to the following project types:

- InstallScript
- InstallScript Object

The DeleteSetupType method deletes the specified setup type from the current project.

Syntax

DeleteSetupType (pSetupType As ISWiSetupType) As Long

Parameters

Table 29 • DeleteSetupType Method Parameters

| Parameter  | Description                          |
|------------|--------------------------------------|
| pSetupType | The setup type object to be deleted. |

Example

The following Visual Basic lines demonstrate the DeleteSetupType method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupType As ISWiSetupType

Set pSetupType = pProj.ISWiSetupTypes.Item(1)
pProj.DeleteSetupType pSetupType

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

DeleteSQLConnection Method

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the DeleteSQLConnection method to remove a SQL Server Connection from the project.

## Syntax

Function DeleteSQLConnection(Connection As ISWiSQLConnection) As Long

## Parameters

**Table 30** ▪ DeleteSQLConnection Method Parameters

| Parameter         | Description                                                 |
|-------------------|-------------------------------------------------------------|
| <b>Connection</b> | Specify the connection you want to remove from the project. |

## Applies To

- ISWiProject

## DeselectLanguage Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the DeselectLanguage method to deselect a language from the current project.

## Syntax

DeselectLanguage (LangId As String)

## Parameters

**Table 31** ▪ DeselectLanguage Method Parameters

| Parameter     | Description                                                                                  |
|---------------|----------------------------------------------------------------------------------------------|
| <b>LangId</b> | Pass the language ID you want to deselect in a string, as in oProject.DeleteLanguage "1036". |

## Applies To

- ISWiProject

## ExportProject Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call ExportProject to convert an .ism file to XML format before checking it into a source code control program.

**Note** ▪ When a project file format is converted to either XML or binary format, the project file extension remains \*.ism.

The .isv file format has been deprecated to version 2.x of InstallShield for Windows Installer and versions of InstallShield Developer prior to 8.x.

### Syntax

ExportProject (strISWiTextProjectFile As String, Optional strISWiProjectFile As String) As Long

### Parameters

**Table 32** ▪ ExportProject Method Parameters

| Parameter              | Description                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------|
| strISWiTextProjectFile | Enter the fully qualified path to the .isv file.                                                                   |
| strISWiProjectFile     | Enter the fully qualified path to the .ism file. This parameter is optional only if the .ism file is already open. |

### Applies To

- ISWiProject

## ExportStrings Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

- *InstallScript Object*
- *Merge Module*

Call `ExportStrings` to copy all or a portion of the string entries for a specific language to a tab-delimited Unicode text file (.txt). You can provide the .txt file to a translator who can update the file with translated text. After it has been translated, you can import the translated string entries into your project by calling the [ImportStrings method](#).

## Syntax

`ExportStrings (strfile As String, dTimeStamp As Date, sLang As String) As Boolean`

## Parameters

**Table 33** • ExportStrings Method Parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>strfile</b>    | Enter the fully qualified path to the text file that will contain the exported strings. If the file exists, the automation interface overwrites it.<br><br>ExportStrings creates a Unicode file.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>dTimeStamp</b> | All string entries have a date and time that they were last modified. This timestamp is useful if you want to give the translator only the string entries that are new or have been modified since the last round of translations.<br><br>To export only the string entries that have been modified since a specific date, specify the earliest date for the string entries you want to export. The automation interface exports the string entries that have changed on or since that date.<br><br>To export all of the entries for the specified language, enter the number 0. |
| <b>sLang</b>      | Specify the identifier for the language whose string entries you want to export to the text file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Applies To

- [ISWiProject](#)

## ForceUpgrade Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

- Merge Module

The ForceUpgrade method upgrades the project from an earlier version of InstallShield to the current version.

Syntax

ForceUpgrade (ISWiProjectFile As String)

Parameters

Table 34 ▪ ForceUpgrade Method Parameters

| Parameter       | Description                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------|
| ISWiProjectFile | Enter the fully qualified path to the project file (.ism) that you want to upgrade. Include the full file name. |

Applies To

- ISWiProject

GenerateGUID Method

**Project ▪** This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The GenerateGUID method generates a new, unique GUID that is returned as a string.

Applies To

- ISWiProject

ImportProject Method

**Note ▪** This method has been deprecated to version 2.x of InstallShield for Windows Installer and versions of InstallShield Developer prior to 8.x.

Call ImportProject to convert an .isv file to an .ism file. If you access your project from a source code control program, InstallShield saves it as a text (.isv) file. However, [OpenProject](#) and ISCmdBld.exe both require a standard InstallShield project (.ism) file.

Later, you can call [ExportProject](#) to convert the .ism file back to an .isv file before [checking it in](#) to your source control program.

ImportProject fails if the project is already open in the automation interface or in InstallShield.

## Syntax

```
ImportProject (strISWiProjectFile As String, strISWiTextProjectFile As String) As Long
```

## Parameters

**Table 35** - ImportProject Method Parameters

| Parameter                     | Description                                                |
|-------------------------------|------------------------------------------------------------|
| <b>strISWiProjectFile</b>     | Enter the fully qualified path to the resulting .ism file. |
| <b>strISWiTextProjectFile</b> | Enter the fully qualified path to the .isv file.           |

## Error Codes

**Table 36** - ImportProject Method Error Codes

| Code        | Description                       |
|-------------|-----------------------------------|
| <b>1007</b> | The project file is already open. |
| <b>1009</b> | Could not import the project.     |
| <b>1012</b> | The .isv file is missing.         |

## ImportStrings Method

**Project** - This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

Call ImportStrings to import the contents of a tab-delimited text file (.txt) into the project for a specific language. This method is useful when you have exported the entries to a text file and had them translated.

Syntax

ImportStrings (strfile As String, sLang As Integer, Optional Enum eiType, Optional strLogFile As String)  
As Boolean

Parameters

Table 37 ▪ ImportStrings Method Parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| strfile    | Enter the fully qualified path to the text file that contains the string entries that you want to import.                                                                                                                                                                                                                                                                                                                                               |
| sLang      | Specify the identifier for the language whose string entries you want to import to the project.                                                                                                                                                                                                                                                                                                                                                         |
| eiType     | Specify how you want to handle conflicts when importing string entries: <ul style="list-style-type: none"><li>● <b>eiIgnore (0)</b>—Do not replace the string entry’s value if it already exists in the project for the specified language.</li><li>● <b>eiOverwrite (1)</b>—Replace the project’s existing string entry with the one in the text file. This is the default value for this optional parameter.</li></ul>                                |
| strLogFile | Specify the fully qualified path to the log file that should contain the status and success of importing the string entries. The log file records any conflicts in importing string entries and lists any improperly formatted, hence unusable, entries. If the log file exists, it is overwritten. <div></div> <div><b>Note ▪</b> This parameter is optional.</div> |

Applies To

- ISWiProject

OpenProject Method

**Project ▪** This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

To open your project so that you can modify it through the automation interface, call `OpenProject` with the fully qualified path to your `.ism` or `.dim` file. This method is equivalent to loading a project in InstallShield.

---

**Note** ▪ *The `ISWiProject.OpenProject` method fails if the project is open in InstallShield.*

## Syntax

OpenProject (strISWiProjectFile As String, Optional ByVal bReadOnly As Boolean) As Long

## Parameters

**Table 38** ▪ OpenProject Method Parameters

| Parameter                 | Description                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>strISWiProjectFile</b> | Enter the fully qualified path to the project file (.ism or .dim).                                                                                                  |
| <b>bReadOnly</b>          | Determines whether the project is opened with write privileges. True opens the project as a read-only file. The default value for this optional parameter is False. |

## Return Values and Errors

**Table 39** ▪ OpenProject Method Return Values and Errors

| Return Value           | Description                                                                                                                                                                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0</b>               | Project successfully opened.                                                                                                                                                                                                                                                                                  |
| <b>1</b>               | Project opened, but is locked by some other process.                                                                                                                                                                                                                                                          |
| <b>2</b>               | Attempted to open project for write access, but project opened in read-only mode.                                                                                                                                                                                                                             |
| <b>3</b>               | There was a problem creating the merge module catalog. Verify that the merge module search path is correct (via the File Locations tab of the Options dialog box or using -o for the Standalone Build), verify that no merge modules on the merge module path are corrupt, or self-register IsMMUpdater2.dll. |
| <b>Error Code 1100</b> | Unable to open file: %1. Ensure that the file is a valid InstallShield project.                                                                                                                                                                                                                               |
| <b>Error Code 1101</b> | Unable to open file: %1. This project was created using a previous version of InstallShield Developer, InstallShield–Windows Installer or InstallShield Express.                                                                                                                                              |
| <b>Error Code 1102</b> | Unable to open file: %1. This project was created using InstallShield Professional or InstallShield Express 2.xx.                                                                                                                                                                                             |
| <b>Error Code 1103</b> | Unable to open file: %1. The project was created using a more recent version of InstallShield Developer or the project has been updated to a more recent version of InstallShield, InstallShield DevStudio, or InstallShield Developer.                                                                       |

# RemoveFeature Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The RemoveFeature method permanently deletes a feature from the current project.

## Syntax

RemoveFeature (Feature As ISWiFeature) As Long

## Parameters

**Table 40** ▪ RemoveFeature Method Parameters

| Parameter | Description                                                       |
|-----------|-------------------------------------------------------------------|
| Feature   | The item in <a href="#">ISWiFeatures</a> that you want to remove. |

## Example

The following code fragment opens a project, deletes the feature named NewFeature1, and then saves and closes the project:

```
Dim pProj As ISWiProject
Dim pFeat As ISWiFeature

Set pProj = New ISWiProject
pProj.OpenProject "C:\Test\SampleProject.ism"

Set pFeat = pProj.ISWiFeatures.Item("NewFeature1")
pProj.RemoveFeature pFeat

pProj.SaveProject
pProj.CloseProject
```

When RemoveFeature is a member of [ISWiFeature](#), it cannot be used to delete the current feature. However, you can call it to delete a subfeature, such as the first subfeature under NewFeature1 in the following example:

```
Set pFeat = pProj.ISWiFeatures.Item("NewFeature1")
pProj.RemoveFeature pFeat.Features(1)
```

## Applies To

- [ISWiProject](#)
- [ISWiFeature](#)

## SaveProject Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

To save any changes that you have made to your project file through the automation interface, call the SaveProject method.

### Syntax

SaveProject ()

### Return Values and Errors

**Table 41** ▪ SaveProject Method Values

| Return Value      | Description                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------|
| ERROR_SUCCESS (0) | Project is saved.                                                                                   |
| Error Code 1104   | Unable to save file: %1. The project is open in read-only mode or is being used by another process. |

### Applies To

- ISWiProject

## ISWiAdvancedFile Object

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

ISWiAdvancedFile represents an advanced file in your project. The advanced file can be an existing one from the Support Files view (or the Support Files/Billboards view) in InstallShield or one added by calling [AddAdvancedFile](#).

Use the project's [ISWiAdvancedFiles](#) collection to access a specific advanced file. You must specify either an index number or the file key for the Item property of ISWiAdvancedFiles.

## Members

**Table 42** • ISWiAdvancedFile Object Members

| Name                   | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>            | Read-Only Property  | Stores the file key of the advanced file. See the description of ISWiFile above for more information about the file key.                                                                                                                                                                                                                                                                        |
| <b>BuildSourcePath</b> | Read-Write Property | Stores the advanced file's fully qualified source filename. Any path variables are resolved to the actual path.                                                                                                                                                                                                                                                                                 |
| <b>Disk</b>            | Read-Write Property | <p>This enumerated integer property specifies the Advanced Files folder in which you want to add the advanced file. Specify one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>edtDisk1 (1)</b>—Specifies the Disk 1 folder.</li> <li>• <b>edtLastDisk (-1)</b>—Specifies the Last Disk folder.</li> <li>• <b>edtOther (0)</b>—Specifies the Other folder.</li> </ul> |

## Example

The file key is visible in the IDE only as the first entry in the Direct Editor view's ISDisk1 table. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

For Each pAdvancedFile In pProj.ISWiAdvancedFiles
    If UCase(pAdvancedFile.BuildSourcePath) = "C:\MY FILES\MYADVANCEDFILE.EXT" Then
        Exit For
    End If
Next

pProj.SaveProject
pProj.CloseProject
```

If the file C:\My Files\MyAdvancedFile.ext is found among the project's setup files, the For loop ends, and pAdvancedFile holds a copy of the ISWiAdvancedFile object for C:\My Files\MyAdvancedFile.ext.

## Applies To

- **ISWiProject**

## ISWiAutomaticUpgradeEntry Object

**Project** • This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

The ISWiAutomaticUpgradeEntry object represents an automatic upgrade item in the Upgrades view of the InstallShield interface.

Members

Table 43 - ISWiAutomaticUpgradeEntry Object Members

| Name              | Type                | Description                                                                                                                           |
|-------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Delete            | Method              | Deletes the AutomaticUpgradeEntry from the project file.                                                                              |
| Name              | Read-Write Property | Sets the name of the upgrade item as displayed in the IDE.                                                                            |
| UpgradedSetupPath | Read-Write Property | Sets the path to the MSI package that needs to be upgraded. The build engine will create the settings required to upgrade this setup. |
| ReleaseFlag       | Read-Write Property | Configure this upgrade entry to only be built into the setup when a certain release flag has been set.                                |

Delete Method

**Project** - This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

Call this method to delete the ISWiAutomaticUpgradeEntry from the project file.

Syntax

Delete()

Applies To

- ISWiAutomaticUpgradeEntry

## ISWiChainPackageData Object

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI

ISWiChainPackageData represents a collection of data pertaining to a chained .msi package in the Releases view of InstallShield. You can retrieve the data pertaining to a chained .msi package by specifying an item in the [ISWiChainPackageData Collection](#).

### Members

**Table 44** - ISWiChainPackageData Object Members

| Property                 | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FilePath</b>          | Read-Only Property  | Gets the filename for the file or folder from the chain package data file.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ISBuildSourcePath</b> | Read-Only Property  | Gets the path and filename for the file or folder from the chain package data file.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>           | Read-Write Property | <p>Gets or sets the option to delete the streamed files after installation. Available options are :</p> <ul style="list-style-type: none"> <li>• <b>ecpoLeaveBehindOnSuccess (0)</b>—Use this value to enable the deletion of the streamed files.</li> <li>• <b>ecpoLeaveBehindOnSuccess (1)</b>—Use this value to disable the deletion of the streamed files.</li> </ul> <p>By default, the Options property is set to the ecpoLeaveBehindOnSuccess (0) option.</p> |
| <b>Package</b>           | Read-Only Property  | Gets the package unique key.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 45** • ISWiChainPackage Object Members

| Property                      | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddChainPackageData</b>    | Method              | Add files or entire folders to the list of streamed files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>DeleteChainPackageData</b> | Method              | Delete the file or folder entry from the list of streamed files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>DisplayName</b>            | Read-Write Property | Gets or sets the display name of the chained .msi package.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>InstallCondition</b>       | Read-Write Property | Gets or sets an installation condition that you want to be used for the chained .msi package. If the condition evaluates to True at run time, the Windows Installer launches the chained .msi package only if the chained package's product has not already been installed.                                                                                                                                                                                                                                                                                                                                             |
| <b>InstallProperties</b>      | Read-Write Property | Gets or sets the properties and their corresponding values if you want to pass one or more properties from the main installation to the chained .msi package during installation.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>ISReleaseFlags</b>         | Read-Write Property | Gets or sets one or more release flags to a chained .msi package that you want to include in only certain builds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                | Read-Write Property | Gets or sets the user interface (UI) level that you want to be used for the chained .msi package. Available options are: <ul style="list-style-type: none"> <li>● <b>ecoUIBasic (0)</b>—Use this option to display the built-in small progress dialog.</li> <li>● <b>ecoUINone (1)</b>—Use this option to run the installation in silent mode.</li> <li>● <b>ecoUIReduced (2)</b>—Use this option to display only modeless dialogs, such as the full-size progress dialog.</li> <li>● <b>ecoUIFull (3)</b>—Use this option to display the modal and modeless dialogs that are available in the .msi package.</li> </ul> |

**Table 45** ■ ISWiChainPackage Object Members (cont.)

| Property                | Type                | Description                                                                                                                                                                                                                                                     |
|-------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Package</b>          | Method              | Gets or sets the path and file name for the .msi package that you want to be added to the chained .msi package.                                                                                                                                                 |
| <b>ProductCode</b>      | Read-Write Property | Gets or sets the string GUID for the product code.<br><br><br><b>Note</b> ■ The package property will automatically add the product code.                                      |
| <b>RemoveCondition</b>  | Read-Write Property | Gets or sets an uninstallation condition that you want to use for the chained .msi package. If the InstallCondition evaluates to False and the RemoveCondition evaluates to True, the Windows Installer removes the chained package's product if it is present. |
| <b>RemoveProperties</b> | Read-Write Property | Gets or sets the properties and their corresponding values if you want to pass one or more properties from the main installation to the chained .msi package during uninstallation.                                                                             |
| <b>SourcePath</b>       | Read-only Property  | Gets the name of the Windows installer package (.msi file).                                                                                                                                                                                                     |

## Applies To

- ISWiProject

## AddChainPackageData Method

**Project** ■ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddChainPackageData method to add files or entire folders to the list of streamed files.

## Syntax

AddChainPackageData (ISBuildSourcePath As String) As ISWiChainPackageData

## Parameters

**Table 46** ▪ AddChainPackageData Method

| Parameter         | Description                                                                            |
|-------------------|----------------------------------------------------------------------------------------|
| ISBuildSourcePath | Pass the path of the file or folder that you want to add to the list of steamed files. |

## Applies To

- ISWiChainPackage Object

## DeleteChainPackageData Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the DeleteChainPackageData method to delete files or entire folders from the list of streamed files.

## Syntax

DeleteChainPackageData (ChainPackageData As String) As ISWiChainPackageData

## Parameters

**Table 47** ▪ DeleteChainPackageData Method

| Parameter        | Description                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------|
| ChainPackageData | Pass the ISWiChainPackageData object that you want to delete from the list of streamed files. |

## Applies To

- ISWiChainPackage Object

## ISWiCustomAction Object

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

ISWiCustomAction represents a custom action in the Custom Actions and Sequences view (or the Custom Actions view) of InstallShield. You can retrieve a custom action by specifying an item in the [ISWiCustomActions](#) collection.

## Members

| Property          | Type                | Description                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ActionType</b> | Read-Write Property | Holds the numeric custom action type. For more information, see <a href="#">Custom Action Type Overview</a> .                                                                                                                                                                                                                                                                             |
| <b>Comment</b>    | Read-Write Property | An optional comment for the custom action.                                                                                                                                                                                                                                                                                                                                                |
| <b>Name</b>       | Read-Write Property | The name of the custom action.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Source</b>     | Read-Write Property | Specifies the source of the custom action. See <a href="#">Creating Custom Actions in the Custom Actions and Sequences View (or the Custom Actions View)</a> for the required Source property for different types of custom actions.                                                                                                                                                      |
| <b>SourceEx</b>   | Write-Only Property | Sets a custom action source property, same as the Source property. SourceEx replaces the existing binary record for the new path when you change a source that is stored in the Binary table. If other custom actions use the path, their path is also updated. Source creates a new binary record when other custom actions use the path. Only the path in the custom action is updated. |
| <b>Target</b>     | Read-Write Property | Specifies the target of the custom action. See <a href="#">Creating Custom Actions in the Custom Actions and Sequences View (or the Custom Actions View)</a> for the required Target property for different types of custom actions.                                                                                                                                                      |

## Applies To

- [ISWiProject](#)

## ISWiComponent Object

**Project** • This information applies to the following project types:

- *Basic MSI*

- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

*Project-specific differences are noted where appropriate.*

ISWiComponent represents a component in the InstallShield user interface. You can retrieve a component by specifying an item in the [ISWiComponents](#) collection. The component can be one created in the IDE or as a result of calling [AddComponent](#).

Many component attributes are available in the automation interface through this object's methods and properties. Refer to the following table to see which methods, properties, and collections are available for your project type.

## Members

**Table 49** • ISWiComponent Object Members

| Name                         | Project                                                               | Type                   | Description                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|-----------------------------------------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddComponentSubFolder</b> | InstallScript,<br>InstallScript<br>Object                             | Method                 | Adds a subfolder to the current ISWiComponent.                                                                                                                                                                                                                                                                                                                           |
| <b>AddDynamicFileLinking</b> | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI, Merge<br>Module | Method                 | Adds a dynamic file link to the current component.                                                                                                                                                                                                                                                                                                                       |
| <b>AddEnvironmentVar</b>     | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module                   | Method                 | Adds an environment variable to the current component.                                                                                                                                                                                                                                                                                                                   |
| <b>AddFile</b>               | All                                                                   | Method                 | Adds a file to the current component.                                                                                                                                                                                                                                                                                                                                    |
| <b>AddRemoveFile</b>         | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module                   | Method                 | Adds a file or folder removal entry to the current component.                                                                                                                                                                                                                                                                                                            |
| <b>Attrib64BitComponent</b>  | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module                   | Read-Write<br>Property | <p>Set this property to True to have the component registered as 64-bit. Setting this property to False causes the component to be registered as 32-bit. If the component is 64-bit and is replacing a 32-bit component, be sure to provide a new GUID via the GUID property.</p> <p>Note that 64-bit support requires version 2.0 of the Windows Installer service.</p> |
| <b>Comments</b>              | All                                                                   | Read-Write<br>Property | Gets or sets the comments for this component.                                                                                                                                                                                                                                                                                                                            |
| <b>Compressed</b>            | InstallScript,<br>InstallScript<br>Object                             | Read-Write<br>Property | This Boolean property gets or sets the component's Compressed property, which specifies whether to compress the component's files (True) or leave them uncompressed (False) when the files are stored in a cabinet file by the release builder.                                                                                                                          |

**Table 49** - ISWiComponent Object Members (cont.)

| Name                              | Project                                    | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|--------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Condition</b>                  | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Contains any condition associated with the component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Destination</b>                | All                                        | Read-Write Property | <p>Gets or sets the component's destination. The following formats are valid:</p> <ul style="list-style-type: none"> <li>• (Windows Installer based projects only:) [INSTALLDIR]</li> <li>• (Windows Installer based projects only:) [ProgramFilesFolder]Subfolder</li> <li>• (InstallScript projects only:) &lt;TARGETDIR&gt;</li> <li>• (InstallScript projects only:) &lt;WINDIR&gt;\Subfolder</li> <li>• C:\FolderName</li> </ul>  <p><b>Important</b> - Setting the Destination property for the ISWiComponent object resets the object's SourceLocation property. Therefore, any code that sets the SourceLocation property should be placed after any code that sets the Destination property.</p> |
| <b>DeviceDriverFlags</b>          | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property is no longer supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>DeviceDriverFlagsEx</b>        | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property enables you to specify the flag settings for device drivers and run-time options directly from the automation layer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>DeviceDriverSetRedist</b>      | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property sets the .dll used at run time for all device driver installations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>DeviceDriverUse64BitRedist</b> | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property is no longer supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 49** - ISWiComponent Object Members (cont.)

| Name                                  | Project                                    | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|--------------------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DeviceDriverUseLocalizedRedist</b> | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property is no longer supported.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Difference</b>                     | InstallScript, InstallScript Object        | Read-Write Property | This Boolean property gets or sets the component's Difference property, which specifies whether to accept (True) or override (False) the default behavior of the media builder when building a differential media—which is to exclude a file in this component from the differential media if the same file (with the same date and time, size, and attributes) exists in each of the specified comparison media. |
| <b>DotNetApplicationFile</b>          | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | To install your assembly as private, set this attribute to the FileKey of the file that contains your assembly. If this property is set to NULL, your assembly will be installed to the Global Assembly Cache.                                                                                                                                                                                                    |
| <b>DotNetAssembly</b>                 | InstallScript, InstallScript Object        | Read-Write Property | This Boolean property gets or sets the component's .NET Assembly property, which specifies whether the component's files are installed as local .NET assemblies (True) or not installed as assemblies (False).                                                                                                                                                                                                    |
| <b>DotNetCOMInterop</b>               | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Set this to True if your .NET assembly needs to be available from COM calls.                                                                                                                                                                                                                                                                                                                                      |
| <b>DotNetInstallerClass</b>           | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Set this to True if your assembly implements methods from the .NET Installer namespace.                                                                                                                                                                                                                                                                                                                           |
| <b>DotNetInstallerClassArgCommit</b>  | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property allows you to specify argument lists for the Installer class when the Commit method is called.                                                                                                                                                                                                                                                                                                      |
| <b>DotNetInstallerClassArgInstall</b> | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property allows you to specify the argument lists for the Install execution context for the Installer class.                                                                                                                                                                                                                                                                                                 |

**Table 49** • ISWiComponent Object Members (cont.)

| Name                                    | Project                                    | Type                | Description                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------|--------------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DotNetInstallerClassArgRollback</b>  | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property allows you to specify argument lists for the Installer class when the Rollback method is called.                                                                                                                                                                                                                                                                         |
| <b>DotNetInstallerClassArgUninstall</b> | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property allows you to specify the argument lists for the Uninstall execution context for the Installer class.                                                                                                                                                                                                                                                                    |
| <b>DotNetPrecompile</b>                 | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | If this property is set to True, at installation the setup creates a native image from the .NET assembly and installs it to the native image cache on the target system. This allows the assembly to load and execute faster, because it restores code and data structures from the native image cache rather than from just-in-time (JIT) compilation.                                |
| <b>DotNetScanAtBuild</b>                | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property instructs the build engine on how to handle your assembly. Set it to one of the following values: <ul style="list-style-type: none"> <li>● <b>ednbNone (0)</b>—Build does nothing.</li> <li>● <b>ednbProps (1)</b>—Build scans your assembly for properties.</li> <li>● <b>ednbDepAndProps (2)</b>—Build scans your assembly for properties and dependencies.</li> </ul> |
| <b>ExtractAtBuild</b>                   | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Gets or sets the component's COM Extract at Build setting. Possible values are True and False.                                                                                                                                                                                                                                                                                         |
| <b>FTPLocation</b>                      | InstallScript, InstallScript Object        | Read-Write Property | Gets or sets the component's FTP Location property, which specifies an FTP location for the component.                                                                                                                                                                                                                                                                                 |
| <b>GUID</b>                             | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Holds a string GUID, also known as the Component Code property, surrounded by braces—{12345678-1234-1234-1234-1234567890AB}, for example.                                                                                                                                                                                                                                              |
| <b>HTTPLocation</b>                     | InstallScript, InstallScript Object        | Read-Write Property | Gets or sets the component's HTTP Location property, which specifies an HTTP location for the component.                                                                                                                                                                                                                                                                               |

| Name           | Project                                             | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KeyPath</b> | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | Read-Write<br>Property |  <p><b>Note</b> ■ <i>ISWiComponent.KeyPathType must be set before setting ISWiComponent.KeyPath. Errors result if this is done in the reverse order.</i></p> <p>Contains the file or registry entry that serves as this component's key path. The exact type is indicated by the KeyPathType property, below.</p> <p>When the key path is a key file, it contains the file key. You can view this value in the Key column of a component's file list, but be aware that file keys are subject to change when the files are dynamically linked. The file key is the same as the Name property of an <b>ISWiFile</b> object.</p> <p>When the key path is a registry value, there is a specially formatted string that contains the registry key. The path to the registry key is enclosed in square brackets and separated from the value name with a vertical bar (or pipe character). For example, the following lines set the key path for the component m_MyComponent to the value MyName under HKEY_LOCAL_MACHINE\Software\MyCompany\Settings:</p> <pre>m_MyComponent.KeyPathType = kptRegistry m_MyComponent.KeyPath = "[HKEY_LOCAL_MACHINE\Software\MyCompany\Settings] MyName"</pre> <p>A file cannot serve as the key file if it is dynamically linked.</p> |

**Table 49** - ISWiComponent Object Members (cont.)

| Name                  | Project                                                | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|--------------------------------------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KeyPathType</b>    | Basic MSI, InstallScript MSI, Merge Module             | Read-Write Property | <p>ISWiComponent.KeyPathType <i>must</i> be set before setting ISWiComponent.KeyPath. Errors result if this is done in the reverse order. Stores a value that points to the precise type of key path contained in the KeyPath property. Specify one of the following types:</p> <ul style="list-style-type: none"> <li>● kptRegistry (1)</li> <li>● kptFile (2)</li> <li>● kptFolder (3)</li> <li>● kptODBC (4)</li> </ul> <p>Note that the automation interface can set the key path type only to kptRegistry or kptFile, but the other values are possible return values if you are reading the current key path type.</p> |
| <b>Miscellaneous</b>  | InstallScript, InstallScript Object                    | Read-Write Property | Gets or sets the component's Miscellaneous property, which associates a text string with the component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Name</b>           | All                                                    | Read-Only Property  | Component name of the current item in the collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>NeverOverwrite</b> | Basic MSI, InstallScript MSI, Merge Module             | Read-Write Property | Instructs the installer whether to replace an existing component. Specify True to leave the existing component or False to replace it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>OSFilter</b>       | InstallScript, InstallScript MSI, InstallScript Object | Read-Write Property | Gets or sets the component's Operating Systems setting. If the target machine's operating system does not match one of the operating systems that are specified for this setting, the component is not installed. By default, components are operating system independent, meaning that none of the component's data are specific to certain operating systems.                                                                                                                                                                                                                                                              |

**Table 49** ■ ISWiComponent Object Members (cont.)

| Name                    | Project | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|---------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>OSFilter (cont.)</b> |         |      | <p>Use the following constants to set this property:</p> <ul style="list-style-type: none"> <li>• eosOSIndependent = 0</li> <li>• eosWin95 = &amp;H10 (16)</li> <li>• eosWin98 = &amp;H40 (64)</li> <li>• eosWinMe = &amp;H80 (128)</li> <li>• eosWinNT4 = &amp;H10000 (65536)</li> <li>• eosWin2000 = &amp;H100000 (1048576)</li> <li>• eosWinXP = &amp;H400000 (4194304)</li> <li>• eosWinServer2003 = &amp;H800000 (8388608)</li> <li>• eosWinVista = &amp;H1000000 (16777216)—These constants are for Windows Vista and Windows Server 2008.</li> <li>• eosWin7 = &amp;H2000000 (33554432)—These constants are for Windows 7 and Windows Server 2008 R2.</li> <li>• eosWin8 = &amp;H4000000 (67108864)—These constants are for Windows 8 and Windows Server 2012.</li> <li>• eosWin81 = &amp;H8000000 (134217728)—These constants are for Windows 8.1 and Windows Server 2012 R2.</li> <li>• eosAll = &amp;HFD100D0 (265355472)</li> </ul> <p>You can specify multiple platforms; for example, <b>eosWin7 Or eosWinServer2008 Or eosWinVista Or eosWinServer2003</b>.</p> <div>  <p><b>Tip</b> ■ Use this property with the <i>IsPlatformSelected</i> property to distinguish between Windows Vista and Windows Server 2008, or between Windows 7 and Windows Server 2008 R2, or between Windows 8 and Windows Server 2012, or between Windows 8.1 and Windows Server 2012 R2.</p> </div> |

| Name                         | Project                                    | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|--------------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PlatformSuiteCheck</b>    | InstallScript, InstallScript Object        | Read-Write Property | <p>In conjunction with the <b>IsPlatformSelected</b> property, gets or sets the component's Platform Suite(s) property, which specifies to what platform suites, if any, the component is specific. Use the following constants to set this property:</p> <ul style="list-style-type: none"> <li>● <b>ecpscAll (0)</b>—The setup installs the component's files only if all of the suites that are specified by the IsPlatformSelected property exist on the target system.</li> <li>● <b>ecpscAtLeastOne (1)</b>—The setup installs the component's files only if at least one of the suites that are specified by the IsPlatformSelected property exist on the target system.</li> <li>● <b>ecpscSuiteIndependent (2)</b>—Installation of the component's files does not depend on the target system's suite.</li> </ul> |
| <b>PotentiallyLocked</b>     | InstallScript, InstallScript Object        | Read-Write Property | This Boolean property gets or sets the component's Potentially Locked property, which specifies whether already-installed versions of the component's files may be locked—that is, in use by another application—during setup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>RegFileToMergeAtBuild</b> | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Provides the complete path to a .reg file to have it merged with the component's registry entries at build time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 49 ■ ISWiComponent Object Members (cont.)

| Name                      | Project                                    | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|--------------------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RegistrationType</b>   | Basic MSI, InstallScript MSI, Merge Module | Property            | <p>The following options are available for determining the source of the registration information for this component:</p> <ul style="list-style-type: none"> <li>● <b>rgtNone (0)</b>—InstallShield will not dynamically extract the data or mark the component as self-registering, but any information in the COM Registration advanced setting will be registered.</li> <li>● <b>rgtSelfReg (-1)</b>—The files in this component will have their self-registration routines invoked by the installer.</li> <li>● <b>rgtExtractAtBuild (-2)</b>—Dynamically extracts COM registration information when you build a release.</li> </ul> <p>Because the Registration Type property has been removed from the component views in the IDE, setting the RegistrationType property in the automation interface has the following effects:</p> <ul style="list-style-type: none"> <li>● Using rgtNone sets the component's COM Extract at Build property to No.</li> <li>● Using rgtSelfReg sets the component's COM Extract at Build property to No, and sets each file in the component to use self-registration.</li> <li>● Using rgtExtractAtBuild sets the component's COM Extract at Build property to Yes, and sets each file in the component not to use self-registration.</li> </ul> |
| <b>RemoteInstallation</b> | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | <p>Use one of the following options to install the component's files locally or leave them on the distribution medium:</p> <ul style="list-style-type: none"> <li>● <b>rfsLocal (0)</b>—Installs the files to the folder stored in the component's Destination property.</li> <li>● <b>rfsSource (1)</b>—Leaves the files on the distribution medium.</li> <li>● <b>rfsOptional (2)</b>—The component follows the feature's property.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>RemoveComponentSubFolder</b>                                                                                                                                                                                                                                                                                                                        | InstallScript, InstallScript Object                       | Method              | Removes a subfolder to the current ISWiComponent.                                                                                                                                                                                                |
| <b>RemoveDynamicFileLinking</b>                                                                                                                                                                                                                                                                                                                        | Basic MSI, InstallScript, InstallScript MSI, Merge Module | Method              | Removes a dynamic file link from the current component.                                                                                                                                                                                          |
| <b>RemoveEnvironmentVar</b>                                                                                                                                                                                                                                                                                                                            | Basic MSI, InstallScript MSI, Merge Module                | Method              | Removes an environment variable from the current component.                                                                                                                                                                                      |
| <b>RemoveFile</b>                                                                                                                                                                                                                                                                                                                                      | All                                                       | Method              | Removes a file from the current component.                                                                                                                                                                                                       |
| <b>RemoveRemoveFile</b>                                                                                                                                                                                                                                                                                                                                | Basic MSI, DIM, InstallScript MSI, Merge Module           | Method              | Removes a file or folder removal entry from the current component. To remove a file or folder removal entry from the project, pass the ISWiRemoveFile object.                                                                                    |
| <b>SelfRegister</b>                                                                                                                                                                                                                                                                                                                                    | InstallScript, InstallScript Object                       | Read-Write Property | This Boolean property gets or sets the component's Self-Register property, which specifies whether the component's files are self-registering.                                                                                                   |
| <b>SharedDLLRefCount</b>                                                                                                                                                                                                                                                                                                                               | All                                                       | Read-Write Property | True indicates that the installer should increment a reference count for each file in this component when it is installed, False otherwise.                                                                                                      |
| <b>SourceLocation</b>                                                                                                                                                                                                                                                                                                                                  | All                                                       | Read-Write Property | Provides the name of a folder in the compressed setup package or in the release location where this component's files are stored when you build a release. This property is identical to a component's Source Location setting in InstallShield. |
|  <p><b>Important</b> • Setting the Destination property for the ISWiComponent object resets the object's SourceLocation property. Therefore, any code that sets the SourceLocation property should be placed after any code that sets the Destination property.</p> |                                                           |                     |                                                                                                                                                                                                                                                  |

**Table 49** ▪ ISWiComponent Object Members (cont.)

| Name              | Project | Type                | Description                                                                                                                    |
|-------------------|---------|---------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Transitive</b> | All     | Read-Write Property | Set this property to True to have the installer re-evaluate the condition when this component is reinstalled, False otherwise. |

### Applies To

- [ISWiFeature](#)

## AddComponentSubFolder Method

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript Object*

The AddComponentSubFolder method adds a component subfolder to the current component or component subfolder.

### Syntax

AddComponentSubFolder (Name As String) As ISWiComponentSubFolder

### Parameters

**Table 50** ▪ AddComponentSubFolder Method

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| <b>Name</b> | Pass the name for the subfolder that you want to add. |

### Example

The following Visual Basic lines demonstrate the AddComponentSubFolder method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.AddComponentSubFolder("MyCompSubFolder")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiComponent
- ISWiComponentSubFolder

AddDynamicFileLinking Method

**Project** ▪ The information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Call AddDynamicFileLinking to add a dynamic file link to a specified component. All of the files that are in the folder that you specify are automatically incorporated into your installation.

**Project** ▪ In Basic MSI, InstallScript MSI, and Merge Module projects, all new dynamic file links that you add use the best practice method of component creation by default. For more information, see [Determining the Appropriate Component Creation Method for Dynamically Linked Files](#).

Syntax

AddDynamicFileLinking (sSourceFolder As String) As ISWiDynamicFileLinking

Parameters

Table 51 ▪ AddDynamicFileLinking Method Parameters

| Parameter     | Description                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------|
| sSourceFolder | Pass the fully qualified path to the folder that contains the files that you want to be dynamically linked. |

Example

The following Visual Basic example adds a dynamic link to **MyDynamicFiles** to the component **MyComponent**:

```
m_ISWiFeature.ISWiComponents("MyComponent").AddDynamicFileLinking "C:\Build 141\MyDynamicFiles"
```

All of the files in the **MyDynamicFiles** folder are added to the project. The folder is scanned before every build, and any new or changed files are automatically incorporated into your project.

Applies To

- ISWiComponent

## AddEnvironmentVar Method

**Project** ▪ The AddEnvironmentVar method applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call AddEnvironmentVar to add an environment variable to a component.

### Syntax

AddEnvironmentVar (sName As String) As ISWiEnvironmentVar

### Parameters

**Table 52** ▪ AddEnvironmentVar Method Parameters

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| sName     | Specifies the name of the environment variable. |

### Example

The following Visual Basic example adds the environment variable **MyEnvironment** to the component **MyComponent**:

```
m_ISWiFeature.ISWiComponents("MyComponent").AddEnvironmentVar "MyEnvironment"
```

### Applies To

- ISWiComponent

## AddFile Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.

Call `AddFile` to add a file to a specified component or, in InstallScript projects, a component subfolder. The files that are added with this method have static file links.

## Syntax

```
AddFile (FileName As String) As ISWiFile
```

## Parameters

**Table 53** • AddFile Method Parameters

| Parameter       | Description                                                                                                               |
|-----------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>FileName</b> | Pass the fully qualified file name for the individual file that you want to add to this component or component subfolder. |

## Example

The following Visual Basic example adds the file `MyFile.exe` to the component `MyComponent`:

```
m_ISWiFeature.ISWiComponents("MyComponent").AddFile "C:\Build 141\MyFile.exe"
```

## Applies To

- `ISWiComponent`
- `ISWiComponentSubFolder`

## AddRemoveFile Method

**Project** • The `AddRemoveFile` method applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

The `AddRemoveFile` method adds a file or folder removal entry to the current component. This file and folder removal capability is useful for scenarios such as removing application-created files that your installation does not otherwise track.

## Syntax

```
AddRemoveFile () As ISWiRemoveFile
```

## Applies To

- `ISWiComponent`

# DeviceDriverFlagsEx Property

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Project-specific differences are noted where appropriate.

The DeviceDriverFlagsEx property enables you to specify the flag settings for device drivers and runtime options directly from the automation layer. You can pass the following property values to this property. Pass more than one value by using OR.

**Table 54** ▪ DeviceDriverFlagsEx Property Values

| Value | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Not set (default).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1     | To replace any existing driver for the device with this driver, pass this property value to the DeviceDriverFlagsEx property. If you do not pass this property and a driver already exists for the device, your driver is not installed.                                                                                                                                                                                                                                                                                                                                                                     |
| 2     | To prevent the Connect Device to Computer dialog from being displayed during the installation of a device driver if a device matching the driver is not connected to a computer, pass this property value.                                                                                                                                                                                                                                                                                                                                                                                                   |
| 4     | If you pass this property value to the DeviceDriverFlagsEx property, the installation creates an Add or Remove Programs entry for the device driver only; the installation does not create an additional entry for the installation itself. DIFxApp does not support this feature on Windows Vista and later.                                                                                                                                                                                                                                                                                                |
| 8     | By default, DIFxApp does not install unsigned driver packages or driver packages that have missing files. To override this default behavior, pass this value to the DeviceDriverFlagsEx property.                                                                                                                                                                                                                                                                                                                                                                                                            |
| 16    | <p>By default, when DIFxApp uninstalls a driver package, DIFxApp does not remove the binary files that were copied to the system when it installed the driver. To override this default behavior, pass this value to the DeviceDriverFlagsEx property.</p> <p>If you do pass this value, DIFxApp removes a binary file from the system only if the binary file is identical to the corresponding binary file in the driver store.</p> <div></div> <p><b>Caution</b> ▪ Pass this value only if you can verify that the driver’s binary files are not required by any other driver package or application.</p> |

**Table 54** ▪ DeviceDriverFlagsEx Property Values (cont.)

| Value              | Definition                                                                                                                                                                                    |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Other value</b> | Invalid. This is a fatal installation error. DIFxApp does not install the component and uninstalls any components in the same installation package that were installed before this component. |

- ISWiComponent

## DeviceDriverSetRedist Property

**Project** ▪ The DeviceDriverSetRedist property applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The DeviceDriverSetRedist property sets the custom action runtime .dll used for all device driver installations in the project. This property takes the following values:

- **eddr32Bit**—Specifies that the device drivers in this project target 32 bit machines and that the installation uses runtime dialogs for English only.
- **eddf32BitLocalized**—Specifies that the device drivers in this project target 32 bit machines and that the installation includes all localized installation runtime dialogs.
- **eddf64Bit**—Specifies that the device drivers in this project target Itanium 64 bit machines and that the installation uses runtime dialogs for English only.
- **eddf64BitLocalized**—Specifies that the device drivers in this project target Itanium 64 bit machines and that the installation includes all localized installation runtime dialogs.
- **eddf64BitAMD**—Specifies that the device drivers in this project target AMD 64 bit machines and that the installation uses runtime dialogs for English only.
- **eddf64BitAMDLocalized**—Specifies that the device drivers in this project target AMD 64 bit machines and that the installation includes all localized installation runtime dialogs.

The English runtime .dll file is smaller than the localized .dll file, so if space is an issue and you do not need the extra language runtime dialogs, use one of the English-only values (not one of the localized values).

If you use one of the localized values, the installation uses a runtime .dll that includes dialogs and text for the following languages:

- Arabic (Saudi Arabia)
- Spanish - Modern Sort (Spain)
- Norwegian (Bokmål) (Norway)
- Chinese (People's ROC)

- Finnish (Finland)
- Dutch (Netherlands)
- Chinese (Taiwan)
- French (France)
- Polish (Poland)
- Czech (Czech Republic)
- Hebrew (Israel)
- Portuguese (Brazil)
- Danish (Denmark)
- Hungarian (Hungary)
- Portuguese (Portugal)
- German (Germany)
- Italian (Italy)
- Russian (Russia)
- Greek (Greece)
- Japanese (Japan)
- Swedish (Sweden)
- English (United States)
- Korean (Korea)
- Turkish (Turkey)

## ImportINIFile Method

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call the ImportINIFile method to import INI files from the automation layer.

## Syntax

ImportINIFile(INIFile As String, [DirectoryID As String])

## Parameters

**Table 55** • ImportINIFile Method Parameters

| Parameter          | Description                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>INIFile</b>     | This represents the full path to the INI file that needs to be imported.                                                                                                       |
| <b>DirectoryID</b> | The directory must be a valid MSI Directory identifier such as INSTALLDIR. The directory is optional if you do not specify it. InstallShield will use the component directory. |

## Applies To

- ISWiComponent

## ImportRegFile Method

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the ImportRegFile method to import the contents of a registry (REG) file into the registry data for a specified component. This method mimics manually importing a REG file in the IDE.

Syntax

ImportRegFile (RegFile As String, Optional OverWrite As Boolean)

Parameters

Table 56 • ImportRegFile Method Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RegFile   | Specify the fully qualified path to the REG file that you want to import.                                                                                                                                                                                                                                                                                                                                                                 |
| OverWrite | <p>Choose one of the following options for instructing ImportRegFile how you want to handle conflicts when merging registry data:</p> <p>True—If a value exists in the component's registry data, overwrite it with the value from the REG file.</p> <p>False—If a value in the REG file is already present in the component's registry data, do not import that value.</p> <p>The default value for this optional parameter is True.</p> |

- ISWiComponent

ISWiRemoveFiles Method

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISWiRemoveFiles method returns an ISWiRemoveFiles collection that contains all of the file and folder removal entries that are associated with the current component.

## Syntax

ISWiRemoveFiles As ISWiRemoveFiles

## Parameters

**Table 57** ▪ RemoveRemoveFile Method Parameters

| Parameter     | Description                                                             |
|---------------|-------------------------------------------------------------------------|
| pRemoveFolder | Pass the <a href="#">ISWiRemoveFile</a> object that you want to remove. |

## Example

The following Visual Basic code illustrates how you would set a property for a specific file removal entry in a component. For the purposes of this example, assume that the variable m\_oMyComp already has a reference to a component.

```
m_oMYComp.ISWiRemoveFiles("RemoveFile1").FileName = "*.txt"
```

## Applies To

- [ISWiComponent](#)

## RemoveComponentSubFolder Method

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript Object*

The RemoveComponentSubFolder method removes the specified component subfolder from the current component or component subfolder.

## Syntax

RemoveComponentSubFolder (pComponentSubFolder As ISWiComponentSubFolder) As Long

## Parameters

**Table 58** ▪ RemoveComponentSubFolder Method Parameters

| Parameter           | Description                                        |
|---------------------|----------------------------------------------------|
| pComponentSubFolder | Pass the subfolder object that you want to remove. |

## Example

The following Visual Basic lines demonstrate the RemoveComponentSubFolder method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
pComponent.RemoveComponentSubFolder pComponentSubFolder

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiComponent
- ISWiComponentSubFolder

RemoveDynamicFileLinking Method

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Call RemoveDynamicFileLinking to remove a dynamic file link from the current component.

Syntax

RemoveDynamicFileLinking (pSourceFolder As ISWiDynamicFileLinking) As Long

Parameters

Table 59 - RemoveDynamicFileLinking Method Parameters

| Parameter     | Description                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------|
| pSourceFolder | Pass the ISWiDynamicFileLinking object to specify a dynamic file link that you want to remove from the project. |

Applies To

- ISWiComponent

# RemoveEnvironmentVar Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call RemoveEnvironmentVar to remove an environment from a specified component.

## Syntax

RemoveEnvironmentVar (sName As ISWiRemoveEnvironmentVar) As Long

## Parameters

**Table 60** ▪ RemoveEnvironmentVar Method Parameters

| Parameter | Description                                                                                    |
|-----------|------------------------------------------------------------------------------------------------|
| sName     | Pass the ISWiEnvironmentVar object to specify an environment variable that you want to remove. |

## Applies To

- ISWiComponent

# RemoveFile Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call RemoveFile to remove a file from a specified component.

## Syntax

RemoveFile (pFile As ISWiFile) As Long

## Parameters

**Table 61** - RemoveFile Method Parameters

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| pFile     | Pass the <a href="#">ISWiFile</a> object you want to remove. |

## Applies To

- [ISWiComponent](#)

## RemoveRemoveFile Method

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The RemoveRemoveFile method removes a file or folder removal entry from the current component. To remove a file or folder removal entry from the project, pass the ISWiRemoveFile object.

## Syntax

RemoveRemoveFile (pRemoveFolder As ISWiRemoveFile) As Long

## Parameters

**Table 62** - RemoveRemoveFile Method Parameters

| Parameter     | Description                                                             |
|---------------|-------------------------------------------------------------------------|
| pRemoveFolder | Pass the <a href="#">ISWiRemoveFile</a> object that you want to remove. |

## Applies To

- [ISWiComponent](#)

## ISWiComponentSubFolder Object

**Project** - This information applies to the following project types:

- *InstallScript*
- *InstallScript Object*

The ISWiComponentSubFolder object represents a component subfolder belonging to the current component or component subfolder. The component subfolder can be an existing one from the InstallShield user interface's Components view or one added by calling [AddComponentSubFolder](#).

Use the project's [ISWiComponentSubFolders](#) collection to access a specific component subfolder. You must specify either an index number or the component subfolder name for the Item property of ISWiComponentSubFolders.

### Members

**Table 63** - ISWiComponentSubFolder Object Members

| Name                                     | Type               | Description                                                                  |
|------------------------------------------|--------------------|------------------------------------------------------------------------------|
| <a href="#">AddComponentSubFolder</a>    | Method             | Adds a subfolder to the component subfolder.                                 |
| <a href="#">AddFile</a>                  | Method             | Adds a file to the component subfolder.                                      |
| <a href="#">DeleteFile</a>               | Method             | Deletes a file from the component subfolder.                                 |
| <a href="#">ISWiComponentSubFolders</a>  | Collection         | Contains all of the subsubfolders associated with this component subfolders. |
| <a href="#">ISWiFiles</a>                | Collection         | Contains all of the files associated with this component subfolder.          |
| <b>Name</b>                              | Read-Only Property | Stores the name of the component subfolder.                                  |
| <a href="#">RemoveComponentSubFolder</a> | Method             | Removes a subfolder from the component subfolder.                            |

### Example

The following Visual Basic code illustrates the use of the ISWiComponentSubFolder object:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
```

```
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
pComponentSubFolder.AddFile("C:\My Files\MyFile.ext")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiComponent

DeleteFile Method

**Project** - This information applies to the following project types:

- InstallScript
- InstallScript Object

Call DeleteFile to delete a file from a specified component subfolder. The files added with this method have static file links, similar to adding files in the IDE.

Syntax

```
DeleteFile (pFile As ISWiFile) As Long
```

Parameters

Table 64 - DeleteFile Method Parameters

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| pFile     | Pass the file object that you want to delete. |

Example

The following Visual Basic example deletes a file from the component subfolder MyCompSubFolder:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder
Dim pFile As ISWiFile

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
Set pFile = pComponentSubFolder.ISWiFiles.Item("MyFile.ext")
pComponentSubFolder.DeleteFile pFile

pProj.SaveProject
pProj.CloseProject
```

## Applies To

- [ISWiComponentSubFolder](#)

## ISWiCondition Object

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

ISWiCondition is a subset of the [ISWiFeature object](#). This object allows you to get and set **conditional logic** for any of your project's features.

## Members

**Table 65** ▪ ISWiCondition Object Members

| Name             | Type                | Description                                                                                  |
|------------------|---------------------|----------------------------------------------------------------------------------------------|
| <b>Condition</b> | Read-Write Property | Gets or sets any conditions that are associated with this feature.                           |
| <b>Level</b>     | Read-Write Property | Gets or sets the install level assigned to the feature when the condition evaluates to TRUE. |

## Applies To

- [ISWiFeature](#)

## ISWiDynamicFileLinking Object

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

*Project-specific differences are noted where appropriate.*

ISWiDynamicFileLinking represents a dynamic file link that belongs to a component. The dynamic file link can be an existing one from the InstallShield user interface or one added by calling [AddDynamicFileLinking](#).

## Members

**Table 66** • ISWiDynamicFileLinking Object Members

| Name                                | Project                                                        | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------|----------------------------------------------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CreateBestPracticeComponents</b> | Basic MSI, DIM, InstallScript MSI, Merge Module                | Read-Write Property | <p>To use the best practice method of component creation for your dynamically linked files, set this property to True.</p> <p>To use the one-component-per-directory method of component creation, set this property to False.</p> <p>For detailed information about the two methods, see <a href="#">Determining the Appropriate Component Creation Method for Dynamically Linked Files</a>.</p> |
| <b>DynamicSubfolders</b>            | Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Set this property to True to include all subfolders that are available in SourceFolder.                                                                                                                                                                                                                                                                                                           |
| <b>ExcludeFiles</b>                 | Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Specify the file types that you want to exclude. Enter the file extension preceded by an asterisk (*). Separate multiple entries with a comma.                                                                                                                                                                                                                                                    |
| <b>IncludeFiles</b>                 | Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Specify the file types that you want to include. Enter the file extension preceded by an asterisk (*). Separate multiple entries with a comma.                                                                                                                                                                                                                                                    |
| <b>SelfRegister</b>                 | Basic MSI, InstallScript MSI, Merge Module                     | Read-Write Property | <p>Set this property to True to self-register every file in the dynamically linked folder.</p> <p>If the <a href="#">Attrib64BitComponent property</a> of the component is set to True, the installation performs 64-bit self-registration on the target system. For more information, see <a href="#">Targeting 64-Bit Operating Systems</a>.</p>                                                |
| <b>SourceFolder</b>                 | Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Specifies the fully qualified path to the folder whose contents should be dynamically linked.                                                                                                                                                                                                                                                                                                     |

| Name             | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Placement</b> | Read-Write Property | <p>This enumerated integer property retrieves or sets the placement of the value in the Value field relative to the specified environment variable's existing value:</p> <ul style="list-style-type: none"> <li>● <b>evpAppend</b>—Appends the value indicated in the Value property to the end of the specified environment variable's existing value.</li> <li>● <b>evpPrefix</b>—Adds the value indicated in the Value property to the beginning of the specified environment variable's existing value.</li> <li>● <b>evpReplace</b>—Replaces the value of the specified environment variable with the value indicated in the Value property.</li> </ul> |
| <b>Value</b>     | Read-Write Property | Retrieves or sets the path or value for this environment variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Applies To

- ISWiComponent

## ISWiFeature Object

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

*Project-specific differences are noted where appropriate.*

ISWiFeature represents a top-level feature or a subfeature in InstallShield. You can retrieve a feature by specifying an item in the **ISWiFeatures** collection.

Many feature properties and attributes are available in the automation interface through this object's methods, properties, and collections. Refer to the following table to see which methods, properties, and collections are available for your project type.

| <b>AddCondition</b>    | Basic MSI, InstallScript MSI                | Method              | Adds a condition to the current ISWiFeature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>AddFeature</b>      | Basic MSI, InstallScript, InstallScript MSI | Method              | Creates an ISWiFeature object as a subfeature of the current ISWiFeature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>AddMergeModule</b>  | Basic MSI, InstallScript MSI                | Method              | Associates a merge module with the current feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>AddObject</b>       | InstallScript                               | Method              | Adds an InstallScript object to the current ISWiFeature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Advertise</b>       | Basic MSI, InstallScript MSI                | Read-Write Property | <p>Gets or sets the Advertisement property for the current feature. Use the following constants to set this property:</p> <ul style="list-style-type: none"> <li>● <b>eaAllow (1)</b>—Use this option to enable advertisement on this feature. Although advertisement is allowed, it is not the default option when the setup is run.</li> <li>● <b>eaFavor (2)</b>—Use this option to have the feature advertised by default. Your end users can always change the advertisement option for a feature in Custom Setup dialog.</li> <li>● <b>eaDisallow (3)</b>—Use this option if you do not want to allow advertising for this feature. Your end users will not be able to choose to have a feature advertised in the Custom Setup dialog.</li> <li>● <b>eaDisableIfNotSupported (4)</b>—Advertisement only works on systems with Internet Explorer 4.01 or higher. If the target system does not meet this criteria, advertising is turned off. If the target system can support advertisement, advertising is allowed.</li> </ul> |
| <b>AttachComponent</b> | Basic MSI, InstallScript, InstallScript MSI | Method              | Associates a component with the current feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Name                  | Project                                              | Type                   | Description                                                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DisplayName</b>    | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI | Read-Write<br>Property | Gets or sets the display name of this feature.                                                                                                                                                                                                                           |
| <b>DisplayNameID</b>  | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI | Read-Write<br>Property | Gets or sets the string identifier for this feature's display name.<br><br><br><b>Note</b> ■ To set this property, the string entry must exist and you must know the string identifier. |
| <b>Encryption</b>     | InstallScript                                        | Read-Write<br>Property | Gets or sets the feature's Encryption property, which specifies whether the files for the feature will be encrypted by the release builder. This property is a Boolean.                                                                                                  |
| <b>Features</b>       | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI | Read-Only<br>Property  | This property contains an <b>ISWiFeatures</b> collection of all this feature's immediate subfeatures, if any.                                                                                                                                                            |
| <b>FTPLocation</b>    | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI | Read-Write<br>Property | Gets or sets the feature's FTP Location property, which specifies an FTP location for the feature.                                                                                                                                                                       |
| <b>HTTPLocation</b>   | InstallScript,<br>InstallScript<br>MSI               | Read-Write<br>Property | Gets or sets the feature's HTTP Location property, which specifies an HTTP location for the feature.                                                                                                                                                                     |
| <b>IncludeInBuild</b> | InstallScript                                        | Read-Write<br>Property | Gets or sets the feature's Include In Build property, which specifies whether the feature should be included in your distribution media. This property is a Boolean.                                                                                                     |
| <b>GUID</b>           | InstallScript                                        | Read-Write<br>Property | Gets or sets the feature's GUID property, which identifies the feature in the setup's log file; if you change a feature's GUID in an update setup, the setup engine treats it as a new feature rather than an update to an existing feature.                             |
| <b>InstallLevel</b>   | Basic MSI,<br>InstallScript<br>MSI                   | Read-Write<br>Property | Gets or sets the install level of this feature.                                                                                                                                                                                                                          |

| <b>ISWiObjects</b>    | InstallScript                               | Collection          | Contains all of the InstallScript objects associated with the current feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Miscellaneous</b>  | InstallScript, InstallScript MSI            | Read-Write Property | Gets or sets the feature's Miscellaneous property, which associates a text string with the feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Name</b>           | Basic MSI, InstallScript, InstallScript MSI | Read-Only Property  | Feature name of the current element in the collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Need</b>           | InstallScript                               | Read-Write Property | <p>Gets or sets the feature's File Need property, which specifies whether a warning, a severe warning, or no warning should be given to end users who deselect the feature. Use the following constants to set this property:</p> <ul style="list-style-type: none"> <li>● <b>efnCritical (0)</b>—Use this option for features that your setup does not allow end users to deselect.</li> <li>● <b>efnHighlyRecommended (1)</b>—Use this option to advise end users that the feature should be installed.</li> <li>● <b>efnStandard (2)</b>—Use this option to let end users deselect the feature with no message issued.</li> </ul> |
| <b>OnInstalled</b>    | InstallScript, InstallScript MSI            | Read-Write Property | Gets or sets the feature's OnInstalled property, which specifies the function to be executed just after the feature is installed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>OnInstalling</b>   | InstallScript, InstallScript MSI            | Read-Write Property | Gets or sets the feature's OnInstalling property, which specifies the function to be executed just before the feature is installed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>OnUninstalled</b>  | InstallScript, InstallScript MSI            | Read-Write Property | Gets or sets the feature's OnUninstalled property, which specifies the function to be executed just after the feature is uninstalled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 68** • ISWiFeature Object Members (cont.)

| Name                      | Project                                     | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|---------------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>OnUninstalling</b>     | InstallScript, InstallScript MSI            | Read-Write Property | Gets or sets the feature's OnUninstalling property, which specifies the function to be executed just before the feature is uninstalled.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Password</b>           | InstallScript                               | Read-Write Property | Gets or sets the feature's Password property, which specifies a password for the feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>ReleaseFlags</b>       | Basic MSI, InstallScript MSI                | Read-Write Property | <p>Gets or sets the release flags that are associated with this feature. Separate multiple flags with a comma.</p> <p>You can specify which release flags you want to use to filter the project's features in the ReleaseFlags property of <a href="#">ISWiRelease</a>.</p>                                                                                                                                                                                                                                                                        |
| <b>RemoteInstallation</b> | Basic MSI, InstallScript MSI                | Read-Write Property | <p>Retrieves or sets the feature's Remote Installation property. Use the following constants to set this property:</p> <ul style="list-style-type: none"> <li>● <b>efrLocal (0)</b>—Means that all of the feature's files are installed onto the target system.</li> <li>● <b>efrSource (1)</b>—Causes the files belonging to this feature to run directly from the source medium, such as a CD-ROM or network server.</li> <li>● <b>efrFollowParent (2)</b>—Gives a subfeature the Remote Installation property of its parent feature.</li> </ul> |
| <b>RemoveComponent</b>    | Basic MSI, InstallScript, InstallScript MSI | Method              | Removes a component from this feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>RemoveFeature</b>      | Basic MSI, InstallScript, InstallScript MSI | Method              | Deletes the specified feature from the project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>RemoveMergeModule</b>  | Basic MSI, InstallScript MSI                | Method              | Removes a merge module from the current feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>RemoveObject</b>       | InstallScript                               | Method              | Removes an InstallScript object from the current ISWiFeature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Required</b>           | Basic MSI, InstallScript MSI                | Read-Write Property | Gets or sets the feature's Required property. This property is a Boolean.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 68** • ISWiFeature Object Members (cont.)

| Name                    | Project                          | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|----------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RequiredFeatures</b> | InstallScript, InstallScript MSI | Read-Write Property | Gets or sets a comma-delimited string that lists the names of the features that are specified in the current feature's Required Features property.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>SetupTypeStatus</b>  | InstallScript, InstallScript MSI | Read-Write Property | <p>Gets or sets the selection status of the feature in the setup type that is specified in the property's argument. Use the following constants to set this property:</p> <ul style="list-style-type: none"> <li>● <b>estSelected (10)</b>—The feature is selected.</li> <li>● <b>estDeselected (11)</b>—The feature is not selected.</li> </ul> <p>In the following Visual Basic code snippet, the Help_Files feature is not selected for the Compact setup type.</p> <pre>Set pFeature = pProject.ISWiFeatures.Item("Help_Files") Set pSetupType = pProject.ISWiSetupTypes.Item("Compact") pFeature.SetupTypeStatus(pSetupType) = 11</pre> |
| <b>StatusText</b>       | InstallScript                    | Read-Write Property | Gets or sets the feature's Status Text property, which specifies the text that end users see in the uppermost line of the progress indicator during the transfer of this feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Visible</b>          | InstallScript                    | Read-Write Property | Gets or sets the feature's Visible property, which specifies whether the feature will be visible in feature dialog boxes during the installation. This property is a Boolean.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Applies To

- ISWiProject

## AddCondition Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddCondition method to add a condition to the current feature.

## Syntax

AddCondition (sKey As String) As ISWiCondition

## Parameters

**Table 69** ▪ AddCondition Method Parameters

| Parameter   | Description                                                                         |
|-------------|-------------------------------------------------------------------------------------|
| <b>sKey</b> | Pass the string version of the condition you want to attach to the current feature. |

## Applies To

- ISWiFeature

## AddMergeModule Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddMergeModule method to associate a merge module with the current feature. This method is similar to adding a merge module to a feature in the Redistributables view.

## Syntax

AddMergeModule (FileName As String)

## Parameters

**Table 70** ▪ AddMergeModule Method Parameters

| Parameter       | Description                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------|
| <b>FileName</b> | Pass the fully qualified file name for the merge module (.msm) file that you want to associate with this feature. |

## Applies To

- ISWiFeature

## AddObject Method

**Project** ▪ This information applies to InstallScript projects.

The AddObject method adds an InstallScript object with the specified moniker to the current feature.

Syntax

AddObject (Moniker As String) As ISWiObject

Parameters

Table 71 • AddObject Method Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Moniker   | Pass the moniker for the InstallScript object that you want to add. To get an InstallScript object's moniker, create a new Professional project in the IDE and add the InstallScript object to a feature, then go to the Direct Editor view's ISFeatureExtended table and see the Moniker column. |

Example

The following Visual Basic lines demonstrate the AddObject method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObj As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObj = pFeature.AddObject ("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiFeature

AttachComponent Method

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

Call the AttachComponent method to associate a component with the current feature. The component must exist (created manually in the IDE or by calling [AddComponent](#)) before you can associate it with a feature.

## Syntax

AttachComponent (Component As ISWiComponent)

## Parameters

**Table 72** - AttachComponent Method Parameters

| Parameter        | Description                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Component</b> | Provide the <b>ISWiComponent</b> object that represents the component you want to associate with this feature. |

## Applies To

- **ISWiFeature**

## DeleteCondition Method

**Project** - This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

Call the DeleteCondition method to delete a condition from the current feature.

## Syntax

DeleteCondition (pCondition As ISWiCondition)

## Parameters

**Table 73** - DeleteCondition Method Parameters

| Parameter         | Description                                                                    |
|-------------------|--------------------------------------------------------------------------------|
| <b>pCondition</b> | The <b>ISWiCondition</b> object representing the condition you want to delete. |

## Applies To

- **ISWiFeature**

## RemoveComponent Method

**Project** - This information applies to the following project types:

- *Basic MSI*

- *InstallScript*
- *InstallScript MSI*

Call `RemoveComponent` to remove a component from a specified feature. Similar to removing a component in the Setup Design views, `RemoveComponent` disassociates a component from its feature, but it does not permanently delete it from the project.

## Syntax

`RemoveComponent (pComponent As ISWiComponent) As Boolean`

## Parameters

**Table 74** • RemoveComponent Method Parameters

| Parameter         | Description                                                             |
|-------------------|-------------------------------------------------------------------------|
| <b>pComponent</b> | Enter the <a href="#">ISWiComponent</a> object that you want to remove. |

## Applies To

- [ISWiFeature](#)

## RemoveMergeModule Method

**Project** • This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

Call the `RemoveMergeModule` method to remove a merge module from only the current feature. (To delete a merge module from the project, call the [DeleteMergeModule](#) method.)

## Syntax

`RemoveMergeModule (FileName As String)`

## Parameters

**Table 75** • RemoveMergeModule Method Parameters

| Parameter       | Description                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------|
| <b>FileName</b> | Pass the fully qualified file name for the merge module (.msm) file that you want to remove from this feature. |

## Applies To

- [ISWiFeature](#)

# RemoveObject Method

**Project** ▪ This information applies to the InstallScript projects.

The RemoveObject method removes the specified **InstallScript object** from the current feature.

## Syntax

RemoveObject (Object As ISWiObject) As Long

## Parameters

**Table 76** ▪ RemoveObject Method Parameters

| Parameter     | Description                             |
|---------------|-----------------------------------------|
| <b>Object</b> | The InstallScript object to be deleted. |

## Example

The following Visual Basic lines demonstrate the RemoveObject method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item("Help_Files")
Set pObject = pFeature.ISWiObjects.Item(1)
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```

## Applies To

- **ISWiFeature**

# ISWiFile Object

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

*Project-specific differences are noted where appropriate.*

ISWiFile represents a file belonging to a component or, in InstallScript projects, a component subfolder in your project. The file can be an existing one from the InstallShield user interface or one added by calling [AddFile](#).

Many feature properties and attributes are available in the automation interface through this object's methods, properties, and collections. Note that some methods, properties, and collections are available for specific project types.

Use the component's [ISWiFiles](#) collection to access a specific file. You must specify either an index number or the file key for the Item property of ISWiFiles. The file key is visible in the File column of the File table in the Director Editor view of InstallShield. In Basic MSI and InstallScript MSI projects, it is also listed under the Key column in a component's file list.

Unfortunately, you might not know the file key, or it might have been reassigned if the files are dynamically linked to the component. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```
Dim m_pFile As ISWiFile

For Each m_pFile In m_pComponent.ISWiFiles
    If UCase(m_pFile.DisplayName) = "MYFILE.EXE" Then
        Exit For
    End If
Next
```

If the file name MyFile.exe is found among the component's files, the For loop ends, and m\_pFile holds a copy of the ISWiFile object for MyFile.exe.

## Members

**Table 77** • ISWiFile Object Members

| Name                    | Project                                                                                             | Type                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Always Overwrite</b> | Basic MSI,<br>InstallScript MSI,<br>Merge Module                                                    | <b>Read-Write<br/>Property</b> | <p>If you want Windows Installer to ignore the actual version number of the selected file, and instead always try to overwrite the file if it is already present on the target system, select this check box. At run time, if this file has the same name and target location as one on the target system, Windows Installer considers the version of the file in your installation to be 65535.0.0.0 when it is determining whether to update the target system's file with the version in your current installation, or to leave the file as is.</p> <p>For more details about how Windows Installer determines whether to overwrite an existing file, see <a href="#">Overwriting Files and Components on the Target System</a>.</p> <p>The maximum version number for a file is 65535.65535.65535.65535.</p> |
| <b>Attributes</b>       | Basic MSI,<br>InstallScript MSI                                                                     | Property<br>(Deprecated)       | This property is no longer supported. Use the Hidden, ReadOnly, System, and Vital properties instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>CompanionFile</b>    | Basic MSI, DIM,<br>InstallScript,<br>InstallScript MSI,<br>InstallScript<br>Object, Merge<br>Module | Read-Write<br>Property         | Reserved for future use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## ISWiFolder Object

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiFolder represents a program folder in a component's Shortcuts explorer in the InstallShield user interface. You can retrieve a folder by specifying an item in the [ISWiFolders](#) collection.

Many folder attributes are available in the automation interface through this object's methods and properties. Refer to the following table to learn which methods, properties, and collections are available for your project type.

## Members

**Table 78** ▪ ISWiFolder Object Members

| Name                                                                                                                                                             | Type                | Description                                                                                                                                                                                                                                            |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddShortcut</b>                                                                                                                                               | Method              | Adds a shortcut object to the current folder object.                                                                                                                                                                                                   |
| <b>AddSubFolder</b>                                                                                                                                              | Method              | Creates another program folder under the current one.                                                                                                                                                                                                  |
| <b>DeleteShortcut</b>                                                                                                                                            | Method              | Deletes the specified shortcut from the current folder object.                                                                                                                                                                                         |
| <b>DeleteSubFolder</b>                                                                                                                                           | Method              | Deletes the specified subfolder from the current one.                                                                                                                                                                                                  |
| <b>Description</b>                                                                                                                                               | Read-Write Property | Contains any descriptive text you have entered for the folder.                                                                                                                                                                                         |
| <b>DisplayName</b>                                                                                                                                               | Read-Write Property | Retrieves or sets the name displayed for a folder.                                                                                                                                                                                                     |
| <b>ISWiShortcuts</b>                                                                                                                                             | Collection          | Contains every shortcut under the current program folder.                                                                                                                                                                                              |
| <b>Name</b>                                                                                                                                                      | Read-Write Property | Retrieves the key name of the folder. This is the name that is displayed in the Shortcuts view in the InstallShield user interface. It is not the same as the DisplayName property.                                                                    |
| <b>SharedFolder</b>                                                                                                                                              | Read-Write Property | This Boolean property retrieves or sets the Shared property of the folder, which specifies whether the folder is always removed from the system (False) or is removed only if it has no subfolders or files that were not created by the setup (True). |
| <b>SubFolders</b>                                                                                                                                                | Collection          | Contains an ISWiFolders collection of each program folder directly under the current folder as laid out in the Shortcuts explorer. See <a href="#">ISWiFolders Collection</a> for an example of using this property to retrieve a subfolder.           |
|  <p><b>Note</b> ▪ This property does not apply to InstallScript projects.</p> |                     |                                                                                                                                                                                                                                                        |

## Applies To

- [ISWiComponent](#)

## AddShortcut Method

**Project** ▪ This information applies to the following project types:

- *Basic MSI*

- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

Call AddShortcut to create a shortcut under the current program folder.

Syntax

AddShortcut (Name As String) As ISWiShortcut

Parameters

Table 79 ▪ AddShortcut Method Parameters

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| Name      | Enter the name you want to give the shortcut in the Shortcuts explorer. |

Applies To

- ISWiFolder

AddSubFolder Method

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

Call the AddSubFolder method to create a program folder directly under the current ISWiFolder object.

## Syntax

AddSubFolder (Name As String) As ISWiFolder

## Parameters

**Table 80** - AddSubFolder Method Parameters

| Parameter   | Description                                                                   |
|-------------|-------------------------------------------------------------------------------|
| <b>Name</b> | Enter the name you want to give the program folder in the Shortcuts explorer. |

## Applies To

- ISWiFolder

## DeleteShortcut Method

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Call DeleteShortcut to create a shortcut from the current folder.

## Syntax

DeleteShortcut (pShortcut As ISWiShortcut) As Long

## Parameters

**Table 81** - DeleteShortcut Method Parameters

| Parameter        | Description                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------|
| <b>pShortcut</b> | Pass the <a href="#">ISWiShortcut Object</a> to specify a shortcut that you want to delete from a folder. |

## Examples

```
Set pShortcut = pFolder.ISWiShortcuts("MyShortcut")
If Not pShortcut Is Nothing Then
    pFolder.DeleteShortcut pShortcut
Next
```

Applies To

- ISWiFolder

DeleteSubFolder Method

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the DeleteSubFolder method to delete the specified subfolder from the current ISWiFolder object.

Syntax

DeleteSubFolder (pSubFolder As ISWiFolder) As Long

Parameters

Table 82 - DeleteSubFolder Method Parameters

| Parameter | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| Name      | Pass the ISWiFolder Object to specify a subfolder that you want to delete from a folder. |

Example

```
Set pSubFolder = pFolder.SubFolders("MySubFolder")
If Not pSubFolder Is Nothing Then
    pFolder.DeleteSubFolder pSubFolder
Next
```

Applies To

- ISWiFolder

ISWiLanguage Object

**Edition** - Support for multilanguage installations is available with InstallShield Premier Edition.

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiLanguage represents a language whose string entries are included in the current project.

To include or exclude languages, use the IsIncluded property on each relevant ISWiLanguage object.

## Members

**Table 83** ▪ ISWiLanguage Object Members

| Name                     | Type                | Description                                                    |
|--------------------------|---------------------|----------------------------------------------------------------|
| <b>AddStringEntry</b>    | Method              | Adds a new string entry to a language.                         |
| <b>DeleteStringEntry</b> | Method              | Removes a string entry from the project.                       |
| <b>Id</b>                | Read-Only Property  | Stores the language identifier of the current language.        |
| <b>IsIncluded</b>        | Read-Write Property | Includes or excludes a language, or checks its current status. |
| <b>ISWiStringEntries</b> | Collection          | Contains all of the string entries in the current language.    |
| <b>Name</b>              | Read-Only Property  | Gets the name of the current language.                         |

## Applies To

- ISWiProject

## AddStringEntry Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object

- Merge Module

Call AddStringEntry to add a new string entry to a language and return ISWiStringEntry.

Syntax

AddStringEntry (sLangId) As ISWiStringEntry

Parameter

Table 84 ▪ AddStringEntry Method Parameter

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| sLangId   | Specify the identifier of the language that should contain the string entry. |

Applies To

- ISWiLanguage

DeleteStringEntry Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call DeleteStringEntry to delete a string entry from a language.

Syntax

DeleteStringEntry (pLangId As ISWiStringEntry)

Parameter

Table 85 ▪ DeleteStringEntry Method Parameter

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| pLangId   | Specify the ISWiStringEntry object to specify a string entry that you want to remove from the project. |

Applies To

- ISWiLanguage

## ISWiLatestSetup Object

---

**Project** - This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

Indicates the Latest Setup (or UpgradedImage) item for a patch configuration where you specify settings for the latest version of your installation.

Each patch configuration must contain at least one latest setup and one previous setup in order for you to create a patch. You can have multiple previous setups per latest setup.

Every application or setup that you intend to patch to a latest setup must be added to the previous setup node.

For example, your company supports versions 1.0 and 1.1 of an application, and you want to upgrade both of these applications to version 2.0. To create a single patch to upgrade both versions, you would add V1.0 and V1.1 as previous setups to the latest setup. Your latest setup would contain V2.0.

## Members

| Name                           | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddPatchExternalFile</b>    | Method             | <p>Adds a <b>ISWiPatchExternalFile</b> object to the current latest setup configuration.</p> <p>Patching an additional external file provides the ability to create a binary file patch against versions of an application file that have not been shipped as part of the previous setup. For example, if one of your application files was potentially updated by another setup, you should reference that file version to ensure that the file level patch can be successfully applied at runtime.</p> |
| <b>AddPatchWholeFile</b>       | Method             | <p>Adds a <b>ISWiPatchWholeFile</b> object to the current latest setup configuration.</p> <p>To include all of your files as whole files, set the IncludeWholeFilesOnly property of patch configuration to True.</p>                                                                                                                                                                                                                                                                                     |
| <b>AddPreviousSetup</b>        | Method             | Adds a <b>ISWiPreviousSetup</b> object to the current latest setup configuration.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>DeletePatchExternalFile</b> | Method             | Deletes specified external file object from the current latest setup configuration.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>DeletePatchWholeFile</b>    | Method             | Deletes specified whole file object from the current latest setup configuration.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>DeletePreviousSetup</b>     | Method             | Deletes specified previous setup object from the current latest setup configuration.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ISWiPatchExternalFiles</b>  | Collection         | Contains all of the external file objects belonging to this latest setup.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>ISWiPatchWholeFiles</b>     | Collection         | Contains all of the whole file objects belonging to this latest setup.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>ISWiPreviousSetups</b>      | Collection         | Contains all of the previous setups belonging to this latest setup (or upgraded image).                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>MsiPath</b>                 | Read-Only Property | <p>Gets or Sets the latest setup path. The latest setup should be the latest version of your installation for which you want to create a patch. The default setting, &lt;ISLatestRelease&gt;, resolves to the last full release that you build.</p> <p>The release path that you specify in this property should be an uncompressed release, ideally created with an administrative installation if the previous product versions were compressed.</p>                                                   |

**Table 86** ▪ ISWiLatestSetup Object Members (cont.)

| Name        | Type               | Description                         |
|-------------|--------------------|-------------------------------------|
| <b>Name</b> | Read-Only Property | Gets name of the latest setup item. |

## Applies To

- [ISWiPatchConfig](#)

## AddPreviousSetup Method

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

Call the AddPreviousSetup method to add previous setup item to the latest setup item. Using this method is similar to adding a previous setup item with the Patch Design View of the IDE. You can set the properties of the new previous setup with the ISWiPreviousSetup object.

## Syntax

```
AddPreviousSetup(PreviousSetupName As String) As ISWiPreviousSetup
```

## Parameter

**Table 87** ▪ AddPreviousSetup Method Parameter

| Parameter                 | Description                            |
|---------------------------|----------------------------------------|
| <b>PreviousSetup Name</b> | Holds the name of previous setup item. |

## Applies To

- [ISWiLatestSetup](#)

## DeletePreviousSetup Method

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

Call the DeletePreviousSetup method to remove specified previous setup object from the latest setup configuration.

Syntax

DeletePreviousSetup (PreviousSetup As ISWiPreviousSetup) As Long

Parameter

Table 88 ▪ DeletePreviousSetup Method Parameter

| Parameter     | Description                                         |
|---------------|-----------------------------------------------------|
| PreviousSetup | Holds the previous setup item object to be deleted. |

Applies To

- ISWiLatestSetup

ISWiMsiPatchSequence Object

**Project ▪** This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Contains all the information that the installer requires to determine the sequence of application of a small update patch relative to all other patches.

## Members

**Table 89** • ISWiMsiPatchSequence Object Members

| Name              | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FamilyName</b> | Read-Write Property | <p>Gets the patch family name. Patches in the same patch family that target the same product version are sorted by the values in the Sequence column. The patches within the patch family are applied to the target product in the order of increasing sequence. The PatchFamily is also used to determine which patches are to be superseded. A patch may be listed in multiple rows and belong to multiple patch families if it applies to more than one product or includes multiple fixes.</p> <p>The Windows Installer does not interpret the PatchFamily value in any way other than comparisons for equality against other PatchFamily values. A PatchFamily value must be unique within the ProductCode targeted by the set of patches. In the complex patching scenarios the PatchFamily identifier may need to be globally unique.</p>                                                                                                                                                                                                                                                                |
| <b>Sequence</b>   | Read-Write Property | <p>Gets or Sets the sequence of this patch within the specified PatchFamily. The value in Sequence is expressed in the format of Version data. The value contains between 1 and 4 fields and each field has a range of 0 to 65535. Members of PatchFamily are sorted and applied to the target product in the order of increasing Sequence values. For example, the following six values are increasing: 1, 1.1, 1.2, 2.01, 2.01.1, 2.01.1.1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Supersede</b>  | Read-Write Property | <p>Set this Boolean property to True to indicate that the small update patch supersedes the updates provided by all patches with lesser Sequence values in the same PatchFamily.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Target</b>     | Read-Write Property | <p>Gets or Sets target product code. A value in this property is optional. If a product code GUID is set in this property and the patch is being applied to the specified product, the patch is sorted and applied as a member of the specified PatchFamily. If a product code GUID is set in this field and the patch is not being applied to the product specified by ProductCode, this row is ignored. If the value in ProductCode is NULL, the patch is sorted and applied as a member of PatchFamily for all targets of the patch regardless of the product code.</p> <p>A patch can have multiple rows in the same PatchFamily and a different ProductCode for each product targeted by the patch. One row for the PatchFamily can specify NULL for ProductCode. If the target product matches a row with a non-NULL ProductCode, the installer uses the matching row and ignores the row with the NULL ProductCode. If none of the specified product codes match the target, the patch is sorted and applied as a member of PatchFamily for all targets of the patch regardless of the product code.</p> |

## ISWiObject Object

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript Object*

The ISWiObject object represents an InstallScript object belonging to your project. The InstallScript object can be an existing one from the InstallShield user interface's Objects view or one added by calling [AddObject](#).

Use the project's [ISWiObjects](#) collection to access a specific InstallScript object. You must specify either an index number or the moniker for the Item property of ISWiObjects. The moniker is visible in the IDE only as the Moniker in the Direct Editor view's ISFeatureExtended table.

### Members

None.

### Example

The following Visual Basic code illustrates the use of the ISWiObject:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObject = pFeature.ISWiObjects.Item("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```

## ISWiPatchConfig Object

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

ISWiPatchConfig represents a patch configuration in the Patch Design view of the InstallShield user interface. You can retrieve a configuration by specifying an item in the ISWiPatchConfigs collection.

## Build Status Events

The ISWiPatchConfig object raises the following status events:

- Public Event ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
- Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
- Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)

These events are raised during the patch build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see [Using Build Status Events](#).

Many feature properties and attributes are available in the automation interface through this object's methods, properties, and collections. The following table lists the ISWiPatchConfig object members.

| Name                                      | Type                | Description                                                                                                                                                                                                                                                    |
|-------------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddLatestSetup</b>                     | Method              | Adds a <b>ISWiLatestSetup</b> object to the current patch configuration.                                                                                                                                                                                       |
| <b>AddMsiPatchSequence</b>                | Method              | Adds a <b>ISWiMsiPatchSequences</b> object to the current patch configuration                                                                                                                                                                                  |
| <b>AllowProductCodeMismatches</b>         | Read-Write Property | Set this property to True if you want the patch creation executable to suppress build-time prompts if product codes differ between the original and latest installations. For a major upgrade, be sure to set True.                                            |
| <b>AllowProductVersionMajorMismatches</b> | Read-Write Property | Set this property to True if you want the patch creation executable to suppress build-time prompts if product versions differ between the original and latest installations.                                                                                   |
| <b>AllowRemoval</b>                       | Read-Write Property | Set this property to True if you would like the patch to be uninstallable without having to uninstall and reinstall the entire application and other patches.<br><br>For more information, see <a href="#">Removing Patches</a> in the Windows Installer help. |
| <b>BuildPatch</b>                         | Method              | Calling this method builds the current patch configuration. This action has the same effect as right-clicking on a patch configuration in the Patch Design view and then selecting 'Build Patch'.                                                              |
| <b>Classification</b>                     | Read-Write Property | Gets or sets the category of upgrade. Examples include Critical Update, Hotfix, and Service Pack.                                                                                                                                                              |
| <b>CreateUpdateLauncher</b>               | Read-Write Property | Set this property to True if you want to create an Update.exe update launcher for the current patch.                                                                                                                                                           |

| Name                          | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CryptographicProvider</b>  | Read-Write Property | <p>Gets or sets the Cryptographic Service Provider (CSP).</p>  <p><b>Note</b> • The Cryptographic Service Provider (CSP) name can be obtained from the Private Key Certificate properties of a user certificate in the EV Vendor Authentication Client tool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>CustomSignArgs</b>         | Read-Write Property | <p>Gets or sets the command-line argument for a sign tool's configuration to digitally sign the patch package and Update.exe file.</p> <p>For example, command-line argument below can be used if the Microsoft built-in signing tool is configured as a custom option to sign the binaries:</p> <pre>sign /fd SHA256 /f "&lt;ProgramFilesFolder&gt;\testCA.pfx" /t http:// timestamp.digicert.com /p MyPassword [filename]</pre> <p>The [filename] variable is a place holder for full file path to be signed. It resolves to full path of the binary file to be signed during build time. By default, a file path will be added at the end of an argument and passed to a custom sign tool. Instead of using a hard-coded path, you can use the path variables or environment variables that are defined in your project.</p>  <p><b>Note</b> • You can use this property if the value of the <b>SigningType</b> property is 1.</p> |
| <b>CustomSignPath</b>         | Read-Write Property | <p>Gets or sets the sign tool's location to digitally sign the patch package and Update.exe file by using that sign tool.</p>  <p><b>Note</b> • You can use this property if the value of the <b>SigningType</b> property is 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>DeleteLatestSetup</b>      | Method              | Deletes specified latest setup object from the current patch configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>DeleteMsiPatchSequence</b> | Method              | Deletes specified patch sequence object from the current patch configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Name                               | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>                 | Read-Write Property | Gets or sets the brief description of your patch.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>DisableDefaultSequencing</b>    | Read-Write Property | <p>Set this property to False if you want to use the default sequencing for the patches of your product. This default sequence accounts for obsolete patches, superseded patches, and patches that have already been applied to the product.</p> <p>If you set this property to True, you can add your own custom sequence. If set True but do not add a sequence, no sequencing information is built into your patch.</p> |
| <b>DisplayName</b>                 | Read-Write Property | Gets or sets the name of your patch                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>EnablePatchCache</b>            | Read-Write Property | When you set this property to True, InstallShield creates intermediate files that are used in subsequent builds to improve performance speed. These intermediate files are left indefinitely on your system. Do not select this check box if you have limited disk space.                                                                                                                                                  |
| <b>GenerateMsiPatchOldAssembly</b> | Read-Write Property | Set this property to True to automatically generate entries for the MsiPatchOldAssemblyFile and MsiPatchOldAssemblyName tables, which allow a patch package that is running under Windows Installer 3.0 or later to patch an assembly in the global assembly cache (GAC) without making a run-time request for the original installation source.                                                                           |
| <b>GeneratePatchGuid</b>           | Read-Write Property | Set this property to True if you want a new GUID generated each time that you build your patch. If you select No, the GUID listed for the Patch GUID property is used. The default setting is True.                                                                                                                                                                                                                        |
| <b>IncludeWholeFilesOnly</b>       | Read-Write Property | Set this property to True to include whole files for every file included in the patch package.                                                                                                                                                                                                                                                                                                                             |
| <b>ISWiLatestSetups</b>            | Collection          | Contains all of the latest setups belonging to this patch configuration                                                                                                                                                                                                                                                                                                                                                    |
| <b>ISWiMsiPatchSequences</b>       | Collection          | Contains all of the patch sequences belonging to this patch configuration.                                                                                                                                                                                                                                                                                                                                                 |

| Name                       | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KeyContainerName</b>    | Read-Write Property | <p>Gets or sets the Private Key Container name associated to the Cryptographic Service Provider (CSP).</p>  <p><b>Note</b> - The Container name can be obtained from the Private Key Certificate properties of a user certificate in the EV Vendor Authentication Client tool.</p>                                                                                                                                     |
| <b>LauncherCompanyName</b> | Read-Write Property | <p>Gets or sets the company name. This will override the default company name for Update.exe with your company name.</p> <p>The company name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>                                                                           |
| <b>LauncherCopyright</b>   | Read-Write Property | <p>Gets or sets the launcher copyright notice. This will override the default copyright notice for Update.exe with your product's copyright notice, enter your product's copyright notice.</p> <p>The copyright notice is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher/</a></p> |
| <b>LauncherDescription</b> | Read-Write Property | <p>Gets or sets the launcher description. This will override the default description for Update.exe with your own description, enter the appropriate description.</p> <p>The description is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>                               |

| Name                       | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LauncherIcon</b>        | Read-Write Property | <p>Gets or sets the icon for the Update.exe file. To use your own icon for the Update.exe file, set the fully qualified name of the file that contains the icon. To specify a file, type an absolute path or a path that is relative to a path variable..</p> <p>By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon's index or resource ID (preceded by a minus sign) to the file name. For example, C:\Temp\MyLibrary.dll,2 indicates the icon with an index of 2, and C:\Temp\MyLibrary.dll,-100 indicates the icon with a resource ID of 100.</p> <p>If you leave this setting blank, InstallShield uses a default icon for your Update.exe file.</p> |
| <b>LauncherPassword</b>    | Read-Write Property | <p>Gets or sets the password to protect your application. You must set True for the PasswordProtected property to activate password protection.</p> <p>When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update.</p> <p>This setting is applicable only to patches that use an Update.exe file.</p>                                                                                                                                                                                                                                                                                                                                                               |
| <b>LauncherProductName</b> | Read-Write Property | <p>Gets or sets the product name. This will override the default product name for Update.exe with your product name.</p> <p>The product name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>                                                                                                                                                                                                                                                                                                                        |

| Name                             | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LauncherProductVer</b>        | Read-Write Property | <p>Gets or sets the product version. This will override the default product version for Update.exe with your product version, enter your product version.</p> <p>The product version is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>                                                         |
| <b>LeaveIntermDecompressed</b>   | Read-Write Property | <p>Set True to leave all .msp file information in a temporary folder. This information can be useful when troubleshooting. If you do not want this information stored, select No.</p>                                                                                                                                                                                                                                                                                                                                         |
| <b>ListOfPatchGuidsToReplace</b> | Read-Write Property | <p>To replace one or more earlier installed patches with the current patch, set this property to the patch GUIDs of those patches, and separate each with a comma. For example:</p> <p>{C86838C9-DEDC-4451-B96F-94AFB9460F15},{C8633E5B-AC44-45d8-B487-C68B3B1F60D6}</p> <p>Setting this property is typically not required, even if you have several patch configurations in the Patch Design view. However, if your patch does not overwrite files added in an earlier patch, it may be necessary to set this property.</p> |
| <b>ListOfTargetProductCodes</b>  | Read-Write Property | <p>Set this property with the product codes that you want to target with this patch, and separate each with a comma. If you enter an asterisk (*) for this setting, InstallShield replaces it at build time by the product codes of the installations that are listed as previous images in this patch configuration.</p>                                                                                                                                                                                                     |
| <b>ManufacturerName</b>          | Read-Write Property | <p>Gets or sets the name of the application's manufacturer.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>MinimumRequiredMsiVersion</b> | Read-Write Property | <p>Specify the minimum version of Windows Installer that is required by the patch. For example, for a minimum of Windows Installer 2.0, enter <b>200</b>. For a minimum of Windows Installer 3.0, enter <b>300</b>. For a minimum of Windows Installer 3.1, enter <b>301</b>.</p>                                                                                                                                                                                                                                             |

| Name                        | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MinorUpdateTargetRTM</b> | Read-Write<br>Property | <p>MSI 3.1 Required</p> <p>Set this property to True if you want your minor-upgrade patch to essentially remove all of the patches up to the release to manufacturing (RTM) version of the product (or the most recent major upgrade of the product, if one has been installed) before applying the current minor-upgrade patch. With this option, all patches (with or without sequencing data) are removed. You do not need to target additional baseline versions and thus increase the patch payload. All end users can successfully apply the patch without applying any intermediate patches.</p> <p>If you do not want your minor-upgrade patch to remove all of those earlier patches, set False. If you select this option, it may be necessary for your patch to contain the information needed to target each of the earlier minor upgrades that were created after the RTM (or the most recent major upgrade of the product, if one was created).</p> <p>For example, if you are creating a minor-upgrade patch for service pack 2 and you select No for this property, your patch needs to target the minor-upgrade patch for service pack 1. You could also optionally target other baselines (such as RTM); doing so would increase the patch payload. Note that if you do not target the RTM version, any end user who has the RTM version but not the service pack 1 minor-upgrade patch would need to install service pack 1 before service pack 2.</p> <p>Versions of Windows Installer earlier than 3.1 ignore this setting.</p> |
| <b>MoreInfoURL</b>          | Read-Write<br>Property | Gets or sets the uniform resource locator (URL) of the support URL that you would like your customers to visit for technical support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Name                         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>OptimizedInstallMode</b>  | Read-Write Property | <p>Set this property to True if you want Windows Installer 3.1 to optimize the patching process so that it reduces the time that is required to apply the current patch. If the patch only modifies a select list of tables, Windows Installer 3.1 ignores the actions that are associated with all other tables. For more information, including the list of tables, see "Patch Optimization" in the Windows Installer Help Library.</p> <p>If you set True for this property, Microsoft Corporation recommends that you test your patch extensively to ensure that it behaves as expected.</p> <p>If you do not want Windows Installer 3.1 to optimize the patching process for the current patch, set False. Windows Installer will run a complete repair of the application when the patch is applied to the target machine.</p> <p>Versions of Windows Installer earlier than 3.1 ignore this property. Windows Installer 3.0 optimizes patches if the patch only modifies the select list of tables. To avoid patch optimization by Windows Installer 3.0, you must use the <code>DisableFlyWeightPatching</code> policy.</p> <p>For more information, see <a href="#">DisableFlyWeightPatching</a> in the Windows Installer Help Library.</p> <p>Versions of Windows Installer earlier than 3.0 run a complete repair of the installation when a patch is applied.</p> |
| <b>OptimizeForLargeFiles</b> | Read-Write Property | <p>Set this property to True to create small bit-level patches for all application files larger than 4 MB in your installation project.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>PasswordProtected</b>     | Read-Write Property | <p>Set this property to True to password-protect your patch, and then set a password using <code>LauncherPassword</code> property. When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update.</p> <p>This setting is applicable only to patches that use an <code>Update.exe</code> file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Name                        | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PatchCacheDirectory</b>  | Read-Write Property | Specify a directory where the temporary files from patch caching should be stored. These intermediate files are left indefinitely on your system.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>PatchCommandLine</b>     | Read-Write Property | <p>Gets or sets the MSI Command-Line Arguments. These Windows Installer arguments are written to Setup.ini.</p> <p>[Startup]</p> <p>CmdLine=Your Value</p> <p>The default value for this property is</p> <p>REINSTALLMODE=omus REINSTALL=ALL</p> <p>The REINSTALL property is a string that contains letters specifying the type of reinstallation to be performed. For more information, see <a href="#">REINSTALLMODE Property</a> in the Windows Installer Library.</p>                                                                                     |
| <b>PatchGuid</b>            | Read-Write Property | Set the patch GUID is used to uniquely identify a patch package. InstallShield automatically generates a new GUID for this property every time you build the patch if the Generate Patch GUID property is set to True.                                                                                                                                                                                                                                                                                                                                         |
| <b>PatchOutputPath</b>      | Read-Write Property | <p>Specify where you want your patch file built or browse for an existing folder. InstallShield appends the following subdirectories to your output location:</p> <p><code>\PatchConfigName\Patch.</code></p>                                                                                                                                                                                                                                                                                                                                                  |
| <b>SignatureDescription</b> | Read-Write Property | <p>Gets or sets the signature description that you want to use for the patch package and Update.exe file, if applicable. The description that you specify is displayed on the User Account Control (UAC) box to the right of the "Program Name:" label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required.</p> <p>If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the "Program Name:" label on the UAC dialog box.</p> |

| Name                     | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SignaturePassword</b> | Read-Write Property | <p>Gets or sets the password for .pfx file that you are using. InstallShield encrypts the password and stores it in your project file (.ism).</p> <p>At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.</p>                                                                                                                                                                                                                                                                                                                                               |
| <b>SignatureSPC</b>      | Read-Write Property | Gets or sets the digital certificate information that you want to use to sign your patch package. Use either the location of the .pfx file or information about the certificate store that contains the certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>SignatureURL</b>      | Read-Write Property | Gets or sets the fully qualified URL—for example, <b>http://www.mydomain.com</b> . This URL is used in your digital signature to link to a site that you would like end users to visit to learn more about your product, organization, or company.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>SigningType</b>       | Read-Write Property | <p>Gets or sets the method to digitally sign the patch package and Update.exe file via entering the value as:</p> <ul style="list-style-type: none"> <li>● To select the standard method in which the default InstallShield sign tool is used to digitally sign the patch package and Update.exe file, enter <b>0</b>.</li> <li>● To select the custom method in which a customized sign tool is used to digitally sign the patch package and Update.exe file, enter <b>1</b>.</li> </ul> <p></p> <p><b>Note</b> - By default, the value of the <b>SigningType</b> property is <b>0</b> to select the standard method.</p> |
| <b>SignPackage</b>       | Read-Write Property | Set this property to True if you want to digitally sign your patch package.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SignUpdateExe</b>     | Read-Write Property | Set this property to True if you want to digitally sign Update.exe file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>TargetProductName</b> | Read-Write Property | Gets or sets the name of the application or the target application suite.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Name                      | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TokenPassword</b>      | Read-Write Property | <p>Gets or sets the EV token password which is encrypted and stored in a project file.</p>  <p><b>Note</b> - Note the following information while specifying an EV token password:</p> <ul style="list-style-type: none"> <li>• An EV certificate vendor determines an EV token password's expiration period and number of the invalid password attempts before it is locked. Therefore, selecting this setting requires changing your password in specific intervals.</li> <li>• If an EV token password is locked, unlocking/ resetting the token password requires an administrator password.</li> </ul> |
| <b>UpdateLauncherName</b> | Read-Write Property | <p>Gets or sets file name (without the .exe file extension) for update launcher that InstallShield should use for the update launcher file that it generates at build time. If this setting is blank, InstallShield uses the default value of 'Update', and the update launcher file is called Update.exe.</p>                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Use64bitSigning</b>    | Read-Write Property | <p>Set this property to True if you want to use the 64-bit signing framework to digitally sign your package.</p> <p>Set this property to False if you want to use the 32-bit signing framework to digitally sign your package.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ValidateAtBuild</b>    | Read-Write Property | <p>Set this property to True if you want to use the upgrading and patching validation every time you build a patch.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## AddLatestSetup Method

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddLatestSetup method to add latest setup item to the current patch configuration. Using this method is similar to adding a latest setup item with the Patch Design View of the IDE. You can set the properties of the new latest setup with the ISWiLatestSetup object.

Syntax

AddLatestSetup(LatestSetupName As String) As ISWiLatestSetup

Parameter

Table 90 - AddLatestSetup Method Parameter

| Parameter       | Description                          |
|-----------------|--------------------------------------|
| LatestSetupName | Holds the name of latest setup item. |

Applies To

- ISWiPatchConfig

DeleteLatestSetup Method

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the DeleteLatestSetup method to remove specified latest setup item from the current patch configuration.

Syntax

DeleteLatestSetup (LatestSetup As ISWiLatestSetup) As Long

Parameter

Table 91 - DeleteLatestSetup Method Parameter

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| LatestSetup | Holds the latest setup item object to be deleted. |

Applies To

- ISWiPatchConfig

ISWiPatchExternalFile Object

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Indicates the external file object that you want to create a binary file patch against versions of an application file that have not been shipped as part of the previous setup.

For example, if one of your application files was potentially updated by another setup, you should reference that file version to ensure that the file level patch can be successfully applied at runtime.

## Members

**Table 92** • ISWiPatchExternalFile Object Members

| Name             | Type               | Description                                                                                                                                                                                                |
|------------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Component</b> | Read-Only Property | Gets or Sets the file path for the external file to associate with the File key that you specified in the FileKey property.<br><br>This is the file that may need to be updated when the patch is applied. |
| <b>FileKey</b>   | Read-Only Property | Gets or Sets the file key with which you want to associate the external file.                                                                                                                              |
| <b>Name</b>      | Read-Only Property | Gets the previous setup name.                                                                                                                                                                              |

- *Basic MSI*
- *InstallScript MSI*

Indicates the file object that you want to include as whole file in your patch rather than have the build perform a bit-level difference of the files.

**Important** • To include all of your files as whole files, set the *Include Whole Files* property for the patch configuration to Yes.

## Members

## ISWiPathVariable Object

**Project** • This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

ISWiPathVariable represents a path variable that is included in the current project. The path variable can be an existing one that was created from the Path Variables view in InstallShield, or one that was added by calling the [AddPathVariable method](#).

**Important** • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see [Predefined Path Variables](#).

| Name               | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>        | Read-Write Property | Retrieves or sets the name of the path variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>PathVarType</b> | Read-Write Property | <p>This enumerated integer property specifies the type of the path variable. Available values are:</p> <ul style="list-style-type: none"> <li>● <b>epvtPreDefined (1)</b>—Predefined path variables are variables that are set to certain standard Windows directories. These variables cannot be renamed or modified, but they can be used in your installation project to point to predefined directories.</li> <li>● <b>epvtCustom (2)</b>—Custom path variables are sometimes referred to as <i>standard path variables</i> or <i>user-defined variables</i>. These variable types are defined through InstallShield. These variables do not rely on any outside sources, such as the registry or system paths.</li> <li>● <b>epvtEnvironment (4)</b>—Environment path variables are based on the values of your system's environment variables. You can set an environment path variable in your project to an existing environment variable on your machine.</li> <li>● <b>epvtRegistry (8)</b>—Registry path variables enable you to define your own variables based on the default value of a specified registry key. The registry key must already be present when you set a path variable to the value of the key.</li> </ul> |
| <b>TestValue</b>   | Read-Write Property | Retrieves or sets the test value of the path variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Value</b>       | Read-Write Property | <p>Retrieves or sets the value of the path variable.</p> <p><b>For Standard Path Variables</b></p> <p>For standard variables, enter the directory to which you would like your variable to point.</p>  <p><b>Note</b> ■ You can also refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called <i>MyRoot</i> with a value of <i>C:\</i>, you can refer to it in a path variable definition for another variable, such as <i>Games</i>. The actual path for the <i>Games</i> variable might be <i>C:\Programs\GameFiles</i>, but you can define <i>Games</i> as <i>&lt;MyRoot&gt;\Programs\GameFiles</i>. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining <i>Games</i> as <i>&lt;MyRoot&gt;\Programs\&lt;Games&gt;</i> actually results in <i>Games</i> defined as <i>C:\Programs\&lt;Games&gt;</i>.</p>                                                                                                                                                             |

Table 94 • ISWiPathVariable Object Members (cont.)

| Name          | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value (cont.) |      | <p><b>For Registry Path Variables</b></p> <p>Enter the complete registry key, with the final “subkey” being the name of the value whose data contains the folder. For example, define <i>MyRegVar</i> as follows:</p> <p>HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue</p> <p>Assume that TestKey has the following subkey and values:</p> <pre>[HKEY_LOCAL_MACHINE\SOFTWARE\TestKey] @="C:\MyPath1" "TestValue"="C:\MyPath2" [HKEY_LOCAL_MACHINE\Software\TestKey\TestValue] @="C:\MyPath3"</pre> <p>Even though HKEY_LOCAL_MACHINE\SOFTWARE\TestKey has a subkey called TestValue, <i>MyRegVar</i> points to the value TestValue, and the current value will be C:\MyPath2. (Note, however, that if a value named TestValue does not exist, InstallShield reads the default value (C:\MyPath3) of the subkey HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue.)</p> <p><b>For Environment Path Variables</b></p> <p>For environment path variables, enter the name of the variable as it appears on the Environment dialog box.</p> |

- Basic MSI
- InstallScript MSI

Indicates the Previous Setup (or TargetImage) item that needs to be patched to latest setup.

## Members

**Table 95** • ISWiPreviousSetup Object Members

| Name                      | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IgnoreMissingFiles</b> | Read-Only Property | Set this Boolean property to True to exclude the files from the patch package that are included in two separate versions cannot be found in a more recent version, unless they have changed in the later version. The advantage of ignoring the files is that only the modified files need to be added to the package. A complete setup image is not required if you choose to ignore missing source files.                                |
| <b>MsiPath</b>            | Read-Only Property | Gets or Sets the previous version setup path that needs to be patched.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Name</b>               | Read-Only Property | Gets the previous setup name.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Order</b>              | Read-Only Property | Gets or Sets the sequence of this patch within the specified PatchFamily. The value in Sequence is expressed in the format of Version data. The value contains between 1 and 4 fields and each field has a range of 0 to 65535. Members of PatchFamily are sorted and applied to the target product in the order of increasing Sequence values. For example, the following six values are increasing: 1, 1.1, 1.2, 2.01, 2.01.1, 2.01.1.1. |
| <b>ValidateFlags</b>      | Read-Only Property | Set this Boolean property to True to indicate that the small update patch supersedes the updates provided by all patches with lesser Sequence values in the same PatchFamily.                                                                                                                                                                                                                                                              |

## Applies To

- ISWiProject

## ISWiProductConfig Object

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

*InstallScript and InstallScript Object projects contain only one element in ISWiProductConfigs; it is named Media.*

*Only some of the members of ISWiProductConfig apply to InstallScript and InstallScript Object projects.*

ISWiProductConfig represents a product configuration in the Releases view of the InstallShield user interface. You can retrieve a configuration by specifying an item in the [ISWiProductConfigs](#) collection.

## Members

**Table 96** • ISWiProductConfig Object Members

| Name                          | Project                                                                         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>AddRelease</b>             | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Method              | Adds a release to the current product configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>ArchitectureValidation</b> | Basic MSI, Merge Module                                                         | Read-Write Property | <p>Set this property to one of the following values to indicate what type of build-time architecture validation you want to perform:</p> <ul style="list-style-type: none"> <li>● <b>epvtLenient (0)</b>—Lenient architecture validation, which is the default type of validation, does not trigger build errors or warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files or the custom action files that are being included in the release.</li> <li>● <b>epvtStrict (1)</b>—Strict validation may trigger build errors and warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files or custom action files that are being included in the release.</li> </ul> <p>The value of this property also influences whether InstallShield includes 32-bit or 64-bit versions of the built-in InstallShield custom action DLLs.</p> <p>To learn more, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p> |
| <b>ConfigFlags</b>            | Basic MSI, InstallScript MSI, Merge Module                                      | Read-Write Property | Gets or sets a string that contains the release flags that you want to use to filter your features. Separate multiple flags with a comma.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 96** - ISWiProductConfig Object Members (cont.)

| Name                       | Project                                                                                              | Type                | Description                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DeleteRelease</b>       | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object,<br>Merge<br>Module | Method              | Deletes the specified release from the current product configuration.                                                                                                                                                                                                                                                                                              |
| <b>GeneratePackageCode</b> | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module                                                  | Read-Write Property | <p>Set this property to True to generate a new package code for every release you build under this product configuration.</p> <p>If this property is not specified or set to False, then the existing package code under the product configuration is used. However, the Summary Information Stream's package code is used if you have not specified one here.</p> |
| <b>ISWiReleases</b>        | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object,<br>Merge<br>Module | Collection          | Contains all of the releases belonging to this product configuration.                                                                                                                                                                                                                                                                                              |
| <b>MSIPackageFileName</b>  | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module                                                  | Read-Write Property | Gets or sets the value of the MSI Package File Name setting of the current product configuration.                                                                                                                                                                                                                                                                  |
| <b>Name</b>                | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object,<br>Merge<br>Module | Read-Only Property  | Returns the name of the current product configuration.                                                                                                                                                                                                                                                                                                             |

**Table 96** - ISWiProductConfig Object Members (cont.)

| Name                      | Project                                             | Type                | Description                                                                                                                                                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PackageCode</b>        | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | Read-Write Property | Gets or sets a string GUID for the package code that is built into this product configuration's releases. Neither the package code you enter in this property nor the Summary Information Stream's package code is used if you set the GeneratePackageCode property, above, to True.                              |
| <b>ProductCode</b>        | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | Read-Write Property | <p>Gets or sets a string GUID for the product code that is built into this product configuration's releases.</p>  <p><b>Note</b> - The GUID must be surrounded by braces{12345678-1234-1234-1234-1234567890AB}, for example.</p> |
| <b>ProductName</b>        | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | Read-Write Property | Gets or sets the product name that is built into this product configuration's releases.                                                                                                                                                                                                                           |
| <b>ProductVersion</b>     | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | Read-Write Property | Gets or sets a string that contains the product's version number, which overrides the Product Version property for every release you build under this product configuration.                                                                                                                                      |
| <b>SetupFileName</b>      | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | Read-Write Property | Gets or sets the value of the Setup File Name setting for the current product configuration.                                                                                                                                                                                                                      |
| <b>Setup64bitLauncher</b> | Basic MSI                                           | Read-Write Property | <p>Gets or sets the value of the 64-Bit Setup Launcher setting for the current product configuration. The possible values are:</p> <ul style="list-style-type: none"> <li>● TRUE - to 64-bit Setup Launcher.</li> <li>● FALSE - to 32-bit Setup Launcher.</li> </ul>                                              |
| <b>Subject</b>            | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | Read-Write Property | Gets or sets the value of the Subject setting for the current product configuration.                                                                                                                                                                                                                              |
| <b>Title</b>              | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | Read-Write Property | Gets or sets the value of the Title setting for the current product configuration.                                                                                                                                                                                                                                |

| Name        | Project                            | Type                | Description                                                       |
|-------------|------------------------------------|---------------------|-------------------------------------------------------------------|
| UpgradeCode | Basic MSI,<br>InstallScript<br>MSI | Read-Write Property | Gets or sets the resulting setup package's Upgrade Code property. |

Applies To

- ISWiProject

AddRelease Method

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the AddRelease method to add a release to the current product configuration. Using this method is similar to creating a release in the Release Wizard or the Releases view of the IDE.

Syntax

AddRelease (ReleaseKey As String) As ISWiRelease

Parameters

Table 97 • AddRelease Method Parameters

| Parameter  | Description                                                                                 |
|------------|---------------------------------------------------------------------------------------------|
| ReleaseKey | Pass the name of the release you would like to create in the current product configuration. |

Applies To

- ISWiProductConfig

DeleteRelease Method

**Project** • This information applies to the following project types:

- Basic MSI

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

Call the `DeleteRelease` method to delete a release from the current product configuration. Using this method is similar to deleting a release in the Releases view of the IDE.

## Syntax

`DeleteRelease (Release As ISWiRelease)`

## Parameters

**Table 98** • DeleteRelease Method Parameters

| Parameter         | Description                                                                             |
|-------------------|-----------------------------------------------------------------------------------------|
| <b>ReleaseKey</b> | Pass the name of the release you want to delete from the current product configuration. |

## Applies To

- *ISWiProductConfig*

# ISWiProperty Object

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

`ISWiProperty` represents a Windows Installer property in the Property Manager of the InstallShield user interface. You can retrieve a property by specifying an item in the `ISWiProperties` collection.

## Members

**Table 99** • ISWiProperty Object

| Name            | Type                | Description                                                               |
|-----------------|---------------------|---------------------------------------------------------------------------|
| <b>Comments</b> | Read-Write Property | Gets or sets the comments associated with the Windows Installer property. |
| <b>Name</b>     | Read-Only Property  | Contains the name of the property.                                        |
| <b>Value</b>    | Read-Write Property | Gets or sets the property's value.                                        |

## Example

The following example sets the property ApplicationUsers to “OnlyCurrentUser,” which means that the option “Only for me” is selected by default in the CustomerInformation dialog:

```
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\ISWiProperties.ism"

Dim pProperty As ISWiProperty
Set pProperty = pProject.ISWiProperties.Item("ApplicationUsers")

pProperty.Value = "OnlyCurrentUser"
pProperty.Comments = "Make ""Only for me"" the default radio button " & _
    "in the CustomerInformation dialog."

pProject.SaveProject
```

## Applies To

- [ISWiProject](#)

## ISWiRelease Object

**Project** • This information applies to the following project types:

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

*Project-specific differences are noted where appropriate.*

ISWiRelease represents an existing release in the Releases view of InstallShield. You can retrieve a release by specifying an item in the [ISWiReleases](#) collection. The release must have been created through the Release Wizard, the Releases view, or the command-line tool ISCmdBld.exe.

| Name                          | Project   | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-----------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AppxDistributionMethod</b> | Basic MSI | Read-Write Property | <p>Gets or sets a string that defines the distribution method for your Windows app package. This property directs which set of warnings that are issued for potential problems related to Windows Store policies or requirements related to sideloading. Available string values are:</p> <ul style="list-style-type: none"> <li>● <b>Sideload</b>—Distribute a Windows app package without having it downloaded from the Windows Store. Sideloaded apps have not been certified by the Windows Store. A common example of a sideloaded app is one that is distributed to an enterprise environment and is internal to a company only. If a package will be sideloaded, you will typically need to sign it, unless your customer wishes to sign it themselves. By default, the AppxDistributionMethod property is set to the Sideload string.</li> <li>● <b>Store</b>—Distribute a Windows app package through the Windows Store. When this value is set, additional warnings will be issued for items that are known to be rejected by Windows Store policy despite the build being valid in a sideloading scenario. If a package is distributed through the Windows Store, it is subjected to additional policies that limit its contents. This type of app does not need to be signed before it is uploaded to Microsoft because Microsoft signs the package.</li> </ul> <p>If you attempt to set an invalid string value for the AppxDistributionMethod property, it will default to the Sideload string.</p> |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                           | Project   | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AppxFrameworkDependency</b> | Basic MSI | Read-Write Property | <p>Set the retail or debug build of the C++ runtime that matches the one used in your product. Valid values are:</p> <ul style="list-style-type: none"> <li>● <b>VC110</b>—For Microsoft Visual C++ 2012 runtime.</li> <li>● <b>VC110D</b>—For Microsoft Visual C++ 2012 debug runtime.</li> <li>● <b>VC120</b>—For Microsoft Visual C++ 2013 runtime.</li> <li>● <b>VC120D</b>—For Microsoft Visual C++ 2013 debug runtime.</li> <li>● <b>VC140</b>—For Microsoft Visual C++ 2015 runtime.</li> <li>● <b>VC140D</b>—For Microsoft Visual C++ 2015 debug runtime.</li> </ul> <p>This property can only be set to above valid values.</p>  <p><b>Note</b> ■ Setting this property does not cause the dependency packages to be installed in sideloading scenarios. For those scenarios, the dependency may have to be delivered manually. Also, the debug versions of the C++ runtime are only useful for internal testing and cannot be uploaded to the Windows Store. For local testing or sideloading, you may also have to deploy the framework package that is included in the Windows 10 SDK.</p> |
| <b>AppxLogoSource</b>          | Basic MSI | Read-Write Property | Gets or sets the path of the image file used to represent the package. This is typically a 50x50 logo.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>AppxMergeDependency</b>     | Basic MSI | Read-Write Property | <p>Gets or sets a list of Windows App packages to merge into the resulting package.</p> <p>Registry data and files from the VFS are copied into this package, but any duplicates of data already in the package are omitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|-------------------------------------|-----------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AppxPackageIdentityName</b>      | Basic MSI | Read-Write Property | Gets or sets a unique alphanumeric string that identifies your Windows App package to Windows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>AppxPackageIdentityPublisher</b> | Basic MSI | Read-Write Property | <p>Gets or sets the subject name (owner name) of the certificate that will be used to sign the package.</p> <p>If a package is distributed through the Windows Store, it doesn't need to be signed before it's uploaded to Microsoft, in which case a signing certificate may be skipped. If a package is sideloaded, it may or may not need to be signed, depending on how your customers expect to handle the package:</p> <ul style="list-style-type: none"> <li>● If the customer prefers to sign the package themselves, they may need a specific publisher set by the AppxPackageIdentityPublisher property that matches their certificate.</li> <li>● If the customer merely wants to deploy the package, they may expect it to be signed with a trusted Authenticode Certificate. The requirements on this are equivalent to those for a trusted UAC prompt.</li> <li>● Sideloaded requires that the Sideloaded setting in Windows is enabled. Sideloaded is enabled by default in the Windows 10 Anniversary Update.</li> </ul> |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                       | Project   | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AppxPackageIdentityVersion | Basic MSI | Read-Write Property | <p>Gets or sets a version number for the Windows App package to which the certificate conforms.</p> <p>The version must contain only numbers and requires four parts using the following format (with values in each part ranging from 0 to 65535):</p> <p><i>majorversion.minorversion.buildnumber.revisionnumber</i>, such as:</p> <p>1.0.0.60325</p> <p>Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering 14.00.25.1, set the following:</p> <p>14.0.25.1</p> |

|------------------------|-----------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AppxPackageType</b> | Basic MSI | Read-Write Property | <p>Set a type of package that you want to be built as part of the release build process. This property converts your Windows desktop application to the modern Windows app packaging format. Available string values for this property are:</p> <ul style="list-style-type: none"> <li>● <b>Appx</b>—Build the Windows App Package. This is default value for the AppxPackageType property.</li> <li>● <b>Msix</b>—MSIX is the next generation software deployment model for Windows platform, bringing in the best of MSI, AppX and App-V - together in a single package. MSIX has the capability to run a traditional Win32 app in a container, achieving application isolation, ease of deployment, fully clean uninstallation and seamless software updates all at the same time.</li> <li>● <b>Appx;Msix</b>—Build both .appx and .msix packages.</li> </ul> <p>To set the required type of package via the AppxPackageType property, the WindowsAppPackage property must be initially set to True.</p> <p>If you attempt to set an invalid string value for the AppxPackageType property, it will defaults to the Appx string.</p> |

|-------------------------------------|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AppxTargetMSIXCore</b>           | Basic MSI | Read-Write Property | <p>Specify whether you want to include MSIX Core extensions as part of the core Windows App package (.appx/.msixWindows App) format, which enables the installation of MSIX apps on older versions of Windows.</p> <p>Setting this property to True allows you to set the additional properties to specify the minimum Windows version and maximum tested Windows version supported by MSIX apps. Additionally, include the MSIX Core entry in the manifest file, along with the specified minimum Windows version and maximum tested Windows version. By default, the AppxTargetMSIXCore property is set to True.</p> <p>Setting this property to False prevents the MSIX Core entry in the manifest file.</p>  <p><b>Tip</b> ■ The MSIX Core package needs MSIX pre-requisite to be installed on the older package.</p> |
| <b>AppxTargetMSIXCoreMaxVersion</b> | Basic MSI | Read-Write Property | <p>Gets or sets the MSIX app's maximum supported tested Windows version. The version must contain only numbers and it requires four parts using the following format (with values in each part ranging from 0 to 65535):</p> <p><i>majorversion.minorversion.buildnumber.revisionnumber</i>, such as:</p> <p>1.0.0.60325</p> <p>Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering 14.00.25.1, enter the following:</p> <p>14.0.25.1</p> <p>To set the AppxTargetMSIXCoreMaxVersion property, the AppxTargetMSIXCore property must be initially set to True.</p>                                                                                                                                                                                                                                                                                      |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                                | Project   | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|-----------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AppxTargetMSIXCoreMinVersion</b> | Basic MSI | Read-Write Property | <p>Gets or sets the MSIX app's minimum supported Windows version. The version must contain only numbers and it requires four parts using the following format (with values in each part ranging from 0 to 65535):</p> <p><i>majorversion.minorversion.buildnumber.revisionnumber</i>, such as:</p> <p>1.0.0.60325</p> <p>Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering 14.00.25.1, enter the following:</p> <p>14.0.25.1</p> <p>To set the AppxTargetMSIXCoreMinVersion property, the AppxTargetMSIXCore property must be initially set to True.</p>                                                                                                                                                                                                                                                                                                                         |
| <b>AppxTargetServer</b>             | Basic MSI | Read-Write Property | <p>Specify whether you want to include Windows Server extensions as part of the core Windows App package (.appx/.msixWindows App) format.</p> <p>Setting this property to True allows you to set the additional properties to specify the minimum Windows Server operating system and maximum tested Windows Server operating system supported by the included apps. By default, the AppxTargetSever property is set to True.</p> <p>Setting this property to False triggers warnings for any items that cannot be represented.</p> <p></p> <p><b>Tip</b> ■ When using InstallShield to create a Windows App package, choose to include either desktop extensions or server extensions, but not both. Although a Windows App package can contain both desktop and server extensions, targeting one set over the other is a more likely scenario.</p> |

| Name                           | Project                                                          | Type                | Description                                                                                                                                                                                                                                                                             |
|--------------------------------|------------------------------------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BrowsersToSupport</b>       | Basic MSI, InstallScript MSI                                     | Read-Write Property | <p>This property indicates which browsers a One-Click Install type of installation will support. Specify the following value:</p> <ul style="list-style-type: none"> <li>● <b>ecitble (0)</b>—Internet Explorer</li> </ul> <p>This property applies only to One-Click Web releases.</p> |
| <b>Build</b>                   | Basic MSI, InstallScript MSI, InstallScript Object, Merge Module | Method              | Builds the current release. This is a full and complete build.                                                                                                                                                                                                                          |
| <b>BuildErrorCount</b>         | Basic MSI, InstallScript MSI, InstallScript Object, Merge Module | Read-Only Property  | After the Build method is run on the ISWiRelease object, BuildErrorCount contains the number of errors that occurred while the build process was running.                                                                                                                               |
| <b>BuildLocation</b>           | Basic MSI, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | Gets or sets a string that identifies the top-level directory where the release will be built.                                                                                                                                                                                          |
| <b>BuildTablesOnly</b>         | Basic MSI, InstallScript MSI, Merge Module                       | Method              | Builds only the Windows Installer tables of the current release.                                                                                                                                                                                                                        |
| <b>BuildTablesRefreshFiles</b> | Basic MSI, InstallScript MSI                                     | Method              | Rebuilds your .msi file and updates the Files table, including any new or changed files in your release.                                                                                                                                                                                |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name                     | Project                                                                         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|---------------------------------------------------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BuildUTF8Database</b> | Basic MSI, InstallScript MSI, Merge Module                                      | Read-Write Property | <p>If you want the Windows Installer database, along with any instance or language transforms, to be built using the UTF-8 encoding, set this Boolean property to True. The UTF-8 encoding supports characters from all languages simultaneously, enabling you to mix and match, for example, Japanese and German, or Russian and Polish, both in text shown to end users and in file names and registry keys. These mixed languages work correctly regardless of the current language of the target system. However, some scenarios result in user interface issues. For example, if an end user specifies the /qb command-line option or uninstalls the product from Add or Remove Programs, Windows Installer uses very small fonts to display the user interface text in a UTF-8 database.</p> <p>If you set this property to True, InstallShield creates an ANSI database when you build your release. This option does not let you mix characters from languages in different code pages.</p> |
| <b>BuildWarningCount</b> | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Only Property  | <p>After the Build method is run on the ISWiRelease object, BuildWarningCount contains the number of warnings that occurred while the build process was running.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                      | Project                                    | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|--------------------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CabCompressionType</b> | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | <p>If the Compressed property is set to True, you can use this CabCompressionType property to specify the type of compression that InstallShield should use when building this release's .cab files. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>ecctlZX (3)</b>—InstallShield uses LZX compression to compress your product's data files into .cab files. This option results in the smallest .cab files; however, it also takes the most time to extract the data from these .cab files at run time.</li> <li>● <b>ecctlMSZIP (1)</b>—InstallShield uses MSZIP compression to compress your product's data files into .cab files.</li> <li>● <b>ecctlNone (0)</b>—InstallShield does not use any compression when creating the .cab files.</li> </ul> <div>  <p><b>Important</b> ■ Using compression generally decreases the size of your compressed files, but the build process may take more time to complete. Depending on the number and size of the files being compressed, the LZX compression and the build may take hours to complete. Therefore, if you select the LZX option, it is recommended that your build machine have the latest hardware to minimize the time that it takes for the build to complete.</p> </div> |
| <b>CachePath</b>          | Basic MSI, InstallScript MSI               | Read-Write Property | <p>Specifies where cached installation files should be stored on the end user's system. Use a hard-coded value such as <b>C:\CachedFiles</b>.</p> <p>This property is used only if the CacheWebDownload property for the current build is set to True.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Name                       | Project                                                                                           | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|---------------------------------------------------------------------------------------------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CacheWebDownload</b>    | Basic MSI,<br>InstallScript<br>MSI                                                                | Read-Write<br>Property | <p>Specifies whether the installation files for the current build should be cached on the target system. Set this to True to cache the installation files on the target system for use with application maintenance and repair.</p> <p>Use the CachePath property to indicate where the cached files should be stored on the end user's system.</p> <p>This property is used only if the WebType property for the current build is set to ewtOneExe (2) (one executable).</p>                                                                                                                                                                                                                                                                  |
| <b>CertificatePassword</b> | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module | Write-Only<br>Property | <p>Sets the password for the .pfx file if the file has a password. InstallShield encrypts the password and stores it in your project file (.ism).</p> <p>At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.</p> <p></p> <p><b>Note</b> ■ This property is not applicable if the certificate that you are using for signing is in a certificate store. Note that if the certificate was imported into the store with password protection, you will be prompted to enter the password at build time.</p> |
| <b>CertificateURL</b>      | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module | Read-Write<br>Property | <p>Gets or sets the URL that is used in your digital certificate to link to a location that you would like end users to visit to learn more about your product, organization, or company. Use a fully qualified URL—for example, <b>http://www.mydomain.com</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                    | Project                                    | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|--------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Compressed</b>       | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | <p>Set this property to True if you want all of the package's files compressed into the .msi file, the .msm file, or Setup.exe, if selected. A value of False means that your application files are placed uncompressed in subfolders of the release location.</p> <p>Unlike the flexibility available in the Release Wizard's Custom Compression Settings panel, this property either compresses all or none of the files in the release.</p>                                                                                                                                             |
| <b>CompressScript</b>   | InstallScript, InstallScript Object        | Read-Write Property | This Boolean property gets or sets the release's Compress Script property, which specifies whether the compiled script file (.inx file) is placed in a cabinet file (True) or is placed uncompressed in the Disk1 disk image folder (False).                                                                                                                                                                                                                                                                                                                                               |
| <b>CopyToFolder</b>     | InstallScript, InstallScript Object        | Read-Write Property | <p>Gets or sets the release's Copy To Folder property, which specifies a folder location to which to copy the release's disk image folders after the release build is complete. Existing folders with the same names as copied folders are overwritten but no folders are deleted.</p> <div>  <p><b>Project</b> ■ For Basic MSI, InstallScript MSI, and Merge Module projects, use the <i>DistributeLoc</i> property instead of <i>CopyToFolder</i> to distribute your release to a folder.</p> </div> |
| <b>CreateAutorunINF</b> | Basic MSI, InstallScript MSI               | Read-Write Property | Set this property to True to create an Autorun.inf file at the root of your release location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>CreatePDF</b>        | Basic MSI, InstallScript MSI               | Read-Write Property | Set this property to True to generate a package definition file for your installation, False otherwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                         | Project                                                                         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|---------------------------------------------------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CryptographicProvider</b> | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | <p>Gets or sets the Cryptographic Service Provider (CSP).</p>  <p><b>Note</b> ■ The Cryptographic Service Provider (CSP) name can be obtained from the Private Key Certificate properties of a user certificate in the EV Vendor Authentication Client tool.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>CubFile</b>               | Basic MSI, InstallScript MSI, Merge Module                                      | Read-Write Property | Gets or sets the name of the validation module (.cub file) that InstallShield uses to validate the built release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>CustomSignArgs</b>        | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | <p>Gets or sets the command-line argument for a sign tool's configuration to digitally sign build-generated files.</p> <p>For example, command-line argument below can be used if the Microsoft built-in signing tool is configured as a custom option to sign the binaries:</p> <pre>sign /fd SHA256 /f "&lt;ProgramFilesFolder&gt;\testCA.pfx" /t http://timestamp.digicert.com /p MyPassword [filename]</pre> <p>The [filename] variable is a place holder for full file path to be signed. It resolves to full path of the binary file to be signed during build time. By default, a file path will be added at the end of an argument and passed to a custom sign tool. Instead of using a hard-coded path, you can use the path variables or environment variables that are defined in your project.</p>  <p><b>Note</b> ■ You can use this property if the value of the <b>SigningType</b> property is <b>eesCustom (1)</b>.</p> |

| Name                      | Project                                             | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|-----------------------------------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DistributeLoc</b>      | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | Read-Write<br>Property | <p>If you want to be able to automatically distribute your release to a folder, specify the location for this property.</p> <p>The DistributeAfterBuild property must be set to True.</p> <p>Note that existing folders with the same names as copied folders are overwritten, but no folders are deleted.</p> <p>If the media format of the selected release is a network image, which creates only one disk image folder, the contents of the disk image folder, rather than the folder itself, are copied. If you chose to create a self-extracting executable file, the executable file, rather than the disk image folders, is copied.</p>  <p><b>Note</b> ■ When both the <i>DistributeLoc</i> and <i>DistributeToURLLoc</i> properties are specified, the release is copied to only the FTP location.</p> |
| <b>DistributeToURLLoc</b> | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | Read-Write<br>Property | <p>If you want to be able to automatically distribute your release to an FTP server, specify the FTP URL for the location for this property.</p> <p>The DistributeAfterBuild property must be set to True.</p>  <p><b>Note</b> ■ If you need to distribute your release to a path outside the FTP default folder, use a double slash (/). For example, to distribute your release to a root-level folder called <b>myproduct</b>, where the URL of the FTP server is <b>ftp://ftp.mydomain.com</b>, enter <b>ftp://ftp.mydomain.com//myproduct</b> for the FTP location.</p> <p>When both the <i>DistributeLoc</i> and <i>DistributeToURLLoc</i> properties are specified, the release is copied to only the FTP location.</p>                                                                                 |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                            | Project                                    | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DistributeToURLPassword</b>  | Basic MSI, InstallScript MSI, Merge Module | Write-Only Property | If a password is required to upload to the FTP location that you are specifying, specify the password for this property.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DistributeToURLUserName</b>  | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | If a user name is required to upload to the FTP location that you are specifying, specify the user name for this property.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>DotNetBaseLanguage</b>       | Basic MSI, InstallScript MSI               | Read-Write Property | Set the language of the user interface of the .NET framework installation. If you set DotNetVersion to '1', then you must set this property.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DotNetBuildConfiguration</b> | Basic MSI, InstallScript MSI               | Read-Write Property | Set this to the active release name in your corresponding .NET Project file. Typical values would be <i>Release</i> and <i>Debug</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>DotNetDelayReboot</b>        | Basic MSI, InstallScript MSI               | Read-Write Property | <p>Specifies whether you want to postpone any reboot associated with installing or updating the .NET Framework on the target system until after your installation has completed.</p> <p>Set this property to True to delay any prompts to reboot until after the installation is finished.</p> <div data-bbox="974 1243 1010 1289" data-label="Image"></div> <p><b>Note</b> ■ The .NET Framework may not function until after the target system is restarted. Therefore, it is strongly recommended that you set this property to False if the .NET Framework is used during the installation.</p> |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                             | Project                            | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|------------------------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DotNetFrameworkLocation</b>   | Basic MSI,<br>InstallScript<br>MSI | Read-Write<br>Property | <p>Set this to one of the following values to indicate how you want to package the .NET Framework redistributable into your installation:</p> <ul style="list-style-type: none"> <li>● <b>eelSourceMedia (0)</b>—Leaves the .NET Framework run time on the root of the source media.</li> <li>● <b>eelSetupExe (1)</b>—Extracts the .NET Framework from Setup.exe at run time.</li> <li>● <b>eelWeb (2)</b>—Downloads the .NET Framework run time from a default URL or a URL specified with the DotNetFrameworkURL property, described below.</li> <li>● <b>eelDotNetNone (3)</b>—Does not include the .NET Framework in the setup.</li> </ul> |
| <b>DotNetFrameworkURL</b>        | Basic MSI,<br>InstallScript<br>MSI | Read-Write<br>Property | If DotNetFrameworkLocation is set to eelWeb (2), this property allows you to override the default location of dotnetfx.exe on the Internet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>DotNetFxCmdLine</b>           | Basic MSI,<br>InstallScript<br>MSI | Read-Write<br>Property | Set the command line that you want to pass to the setup inside of the .NET 1.1 redistributable (dotnetfx.exe).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>DotNetLanguagePackCmdLine</b> | Basic MSI,<br>InstallScript<br>MSI | Read-Write<br>Property | Set the command line that you want to pass to the setup inside the .NET 1.1 language pack redistributables (langpack.exe).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>DotNetLanguagePacks</b>       | Basic MSI,<br>InstallScript<br>MSI | Read-Write<br>Property | Specify the language identifiers representing the additional .NET 1.1 language packs that you want to install.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>DotNetUI</b>                  | Basic MSI,<br>InstallScript<br>MSI | Read-Write<br>Property | Set this property to True if you want to the user interface (UI) from the .NET Framework installation displayed at run time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>DotNetVersion</b>             | Basic MSI,<br>InstallScript<br>MSI | Read-Write<br>Property | Set this property to 1 if you want to ship .NET 1.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name                    | Project                                   | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|-------------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>EnableDifference</b> | InstallScript,<br>InstallScript<br>Object | Read-Write<br>Property | This Boolean property gets or sets the release's Differential Media property, which specifies whether the current release (the release that is selected in the Releases view) is a differential release—that is, a release that contains only those files that were absent from one or more of a specified set of existing releases—or a full release, which contains all your product's files, so that your product can be installed on a system on which no version of your product is currently installed.                                                                                                                                    |
| <b>EnableLangDlg</b>    | All                                       | Read-Write<br>Property | Set this property to True to display the Language Dialog from Setup.exe.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ExpirationDate</b>   | Basic MSI,<br>InstallScript<br>MSI        | Read-Write<br>Property | <p>Gets or sets an expiration date (ISWiDate) for Setup.exe. If this property is set, end users cannot launch the Setup.exe file on or after the specified date.</p> <p>Following is sample Visual Basic code that sets the expiration date to December 30, 2012.</p> <pre>ISWiDate date date.wYear = 2012 date.wMonth = 12 date.wDay = 30 pISWiRelease.ExpirationDate = date</pre> <p>If you use this property to get or set an expiration date, you can use the ExpirationMessage property to get or set the message that you want to be displayed at run time when an end user tries to launch Setup.exe on or after the expiration date.</p> |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name                     | Project                                   | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|-------------------------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ExpirationMessage</b> | Basic MSI,<br>InstallScript<br>MSI        | Read-Write<br>Property | <p>If you use the ExpirationDate property to set an expiration date, you can use the ExpirationMessage property to get or set the message that you want to be displayed at run time when an end user tries to launch Setup.exe on or after the expiration date.</p> <p>Following is sample Visual Basic code that sets an expiration message.</p> <pre>pISWiRelease.ExpirationMessage = "This setup expired on %s. The setup will now exit."</pre> |
| <b>FilterLangs</b>       | Basic MSI,<br>InstallScript<br>MSI        | Read-Write<br>Property | Set this property to True to filter language-specific components according to your settings in the SupportedLangsData property, below.                                                                                                                                                                                                                                                                                                             |
| <b>FTPFolder</b>         | InstallScript,<br>InstallScript<br>Object | Read-Write<br>Property | Gets or sets the release's FTP Site Folder property, which specifies the folder on the FTP server to which you want to copy the disk image folders. This property is applicable only if the FTPHostAddress property is not empty.                                                                                                                                                                                                                  |
| <b>FTPHostAddress</b>    | InstallScript,<br>InstallScript<br>Object | Read-Write<br>Property | Gets or sets the release's FTP Host Address property, which specifies the Uniform Resource Locator (URL) of an FTP server to which the build process should upload the disk image folders. Leave this property empty if you do not want this release uploaded to an FTP server.                                                                                                                                                                    |
| <b>FTPPassword</b>       | InstallScript,<br>InstallScript<br>Object | Read-Write<br>Property | Gets or sets the release's FTP Site Password property, which specifies the password for the user name that you enter in the FTPUserName property. This property is applicable only if the FTPHostAddress property is not empty.                                                                                                                                                                                                                    |
| <b>FTPUserName</b>       | InstallScript,<br>InstallScript<br>Object | Read-Write<br>Property | Gets or sets the release's FTP Site User Name property, which specifies the user name with which you want to gain access to the FTP server. This property is applicable only if the FTPHostAddress property is not empty.                                                                                                                                                                                                                          |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name                           | Project                                    | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|--------------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GenerateFileHashValues</b>  | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | <p>Indicates whether you want to populate the MsiFileHash table for every unversioned file in your build.</p> <p>Set this to True to populate the MsiFileHash table for every unversioned file in your build. Set this to False if you do not want to populate the MsiFileHash table. If this property is set to False, InstallShield builds any entries that are found in the project's MsiFileHash table (populated using the Direct Editor).</p> <p>If you have already populated the MsiFileHash table for a particular file, the build uses that information instead of generating the information at build time.</p> |
| <b>GenerateOneClickInstall</b> | Basic MSI, InstallScript MSI               | Read-Write Property | <p>Set this property to True to create a One-Click Install. If this property is set to True, you must specify file names in the OneClickHTMLBaseName and OneClickCabJarBaseName properties for this release.</p> <p>This property is ignored unless the release's Media Format property is set to Web via the Release Wizard's Media Type panel.</p>                                                                                                                                                                                                                                                                       |
| <b>IFTWCabSizeInKb</b>         | Basic MSI, InstallScript MSI               | Read-Write Property | <p>Specifies the size, in kilobytes, of the cabinet (.cab) files built for the Web media type. Specify the value 0 (zero) to build a separate cabinet file for each component.</p> <p>This property is used only if the WebType property for the current release is set to ewtIFTW (1) (Install From The Web).</p>                                                                                                                                                                                                                                                                                                         |
| <b>InitDlgProductName</b>      | InstallScript, InstallScript Object        | Read-Write Property | Gets or sets the release's Init Dialog Product Name property, which specifies the product name to display in the setup initialization dialog box. If you leave this property empty, the product name that you specify in the General Information view.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>JSharpCmdLine</b>           | Basic MSI, InstallScript MSI               | Read-Write Property | Specify a command-line parameter to pass to vjredist.exe. Consult Microsoft Support for valid command-line parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Name                         | Project                                                                         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------|---------------------------------------------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KeepUnusedDirectories</b> | Basic MSI, InstallScript MSI, Merge Module                                      | Read-Write Property | <p>Specify whether you want InstallShield to remove unused directories from the Directory table of the .msi file when you build this release. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>False</b>—If a directory that is listed in the Directory column of the Directory table is not referenced in any known location in the .msi file, InstallShield removes it from the Directory table of the .msi file that it creates at build time. For Basic MSI and InstallScript MSI projects, this occurs after any merge modules are merged, but only directories that are present in the .msi file are removed; therefore, if a merge module contains new unused directories in its Directory table, the new unused directories are added to the installation.</li> <li>● <b>True</b>—InstallShield does not remove any directories from the Directory table of the .msi file that it creates at build time.</li> </ul> <p>The default value is False.</p> <div>  <p><b>Note</b> ■ Under some conditions, predefined directories cannot be resolved, causing an installation to fail. Removing unused directories from the Directory table enables you to avoid unnecessary failures. Therefore, it is recommended that you do not keep unused directories.</p> </div> |
| <b>KeyContainerName</b>      | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | <p>Gets or sets the Private Key Container name associated to the Cryptographic Service Provider (CSP).</p> <div>  <p><b>Note</b> ■ The Container name can be obtained from the Private Key Certificate properties of a user certificate in the EV Vendor Authentication Client tool.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>MSI30EngineURL</b>          | Basic MSI, InstallScript MSI                                      | Read-Write Property | <p>Gets or sets the uniform resource locator (URL) for the location of the engine. This is the location that the installation file uses at run time to download the engine.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>MsiEngineLocation</b>       | Basic MSI, InstallScript MSI                                      | Read-Write Property | <p>Specifies where the MSI engine installers should be located. Set this property to one of the following:</p> <ul style="list-style-type: none"> <li>● <b>eelSourceMedia (0)</b>—Copy from the source media. Leaves the MSI engine installers you selected on the root of the source media. This option is not available for Web media types or Network Image media types with all of your files compressed into Setup.exe.</li> <li>● <b>eelSetupExe (1)</b>—Extract engine from Setup.exe.</li> <li>● <b>eelWeb (2)</b>—Download engine from the Web. If you use this setting, be sure to set the MSI30EngineURL property to appropriate Web locations.</li> </ul> |
| <b>MsixAppInstallerFileUrl</b> | Basic MSI                                                         | Read-Write Property | <p>Gets or sets the App Installer file location.</p> <p>The App Installer file can be hosted in a shared location like a HTTP endpoint or a UNC shared folder or a local file share, and includes the path to find the MSIX packages to be installed. Users install the app from the shared location or from the web and enable periodic checks for new updates.</p>                                                                                                                                                                                                                                                                                                  |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name                                 | Project   | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------|-----------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MsixAppInstallerVersion</b>       | Basic MSI | Read-Write Property | Gets or sets the version of App Installer file. A version string in quad notation, <i>Major.Minor.Build.Revision</i> , such as 1.0.0.60325.                                                                                                                                                                                                                                                                                                                                                          |
| <b>MsixAutomaticBackgroundTask</b>   | Basic MSI | Read-Write Property | <p>Specify whether you want to allow the check for app updates in the background regardless the app is launched or not.</p> <p>Setting this property to True enables the check for updates in the background regardless the app is launched or not. A check is made every 8 hours independently of whether the user launched the app.</p> <p>Setting this property to False disables the check for updates in the background regardless the app is launched or not.</p>                              |
| <b>MsixForceUpdateFromAnyVersion</b> | Basic MSI | Read-Write Property | <p>Specify whether you want to allow changes in the app's version.</p> <p>Setting this property to True allows the app's version to be incremented or decremented. Without setting this property, the app can only be updated to a higher version and Windows deployment service will not allow downgrade to older version. Setting this property to True is useful to perform rollbacks to older app package versions.</p> <p>Setting this property to False prevents the app's version change.</p> |

| Name                               | Project   | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------|-----------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MsixHoursBetweenUpdateCheck</b> | Basic MSI | Read-Write Property | <p>Set the frequency with which you want the deployment service will check for an update to the App Installer file. Valid values for this property are: 0, 2, 4, 8, 16, and 24.</p> <p>This property can only be set to valid values.</p> <p>If the MsixHoursBetweenUpdateCheck property is set to 0, the deployment service will check for updates every time the application is launched.</p> <p>For other valid values, the deployment service will check for updates when the application is launched only if it hasn't previously checked within last number of hours set for the MsixHoursBetweenUpdateCheck property. For example, if the MsixHoursBetweenUpdateCheck property is set to 16, the deployments service will check for updates when the application is launched, but only if it hasn't already checked for updates in the last 16 hours. When an update is available, the Windows deployment service will automatically download it. The update will be installed once the application is closed.</p> <p>To set the MsixHoursBetweenUpdateCheck property to its required valid value, the UpdateSettingsOnAppLaunch property must be initially set to True.</p> |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                       | Project                                                   | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|-----------------------------------------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PrecompressionEvent</b> | Basic MSI, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | <p>Gets or sets the command that you want to be run after InstallShield has built the .msi package and the .cab files (if your product's data files are to be stored in .cab files). Note that this event occurs after .cab files are streamed into the .msi package, but before the .msi package has been digitally signed and streamed into the Setup.exe file.</p> <p>When you are specifying a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see <a href="#">Specifying Commands that Run Before, During, and After Builds</a>.</p> <p>Following is sample Visual Basic code that sets two commands:</p> <pre>pISWiRelease.PrecompressionEvent = "Event1" + vbCrLf + "Event2"</pre> <p>At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.</p>  <p><b>Edition</b> ■ This property is available in the Premier edition of InstallShield.</p> |
| <b>PreProcessorDefines</b> | InstallScript, InstallScript Object                       | Read-Write Property | Gets or sets the release's Compiler Preprocessor Defines setting, which specifies any preprocessor variable definitions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>PreviousPackage</b>     | Basic MSI, InstallScript MSI                              | Read-Write Property | Specifies the fully qualified path to a previous release (.msi file) to minimize the size of future patch packages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ReleaseFlags</b>        | Basic MSI, InstallScript MSI                              | Read-Write Property | Gets or sets a string that contains the release flags that you want to use to filter your features. Separate multiple flags with a comma.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name                          | Project                                     | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|---------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RequiredExecutionLevel</b> | Basic MSI, InstallScript, InstallScript MSI | Read-Write Property | <p>Gets or sets the minimum level required by your installation's Setup.exe file for running the installation (the setup launcher, any InstallShield prerequisites, and the .msi file) on Windows Vista and later platforms. The available options are:</p> <ul style="list-style-type: none"> <li>● <b>erelAsInvoker (0)</b>—Setup.exe does not require administrative privileges, and all users can run it without administrative privileges. Setup.exe does not display any UAC messages prompting for credentials or for consent. This is the default option for Basic MSI projects.</li> <li>● <b>erelAsHighestAvail (1)</b>—Setup.exe prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges. This is the default option for InstallScript and InstallScript MSI projects.</li> <li>● <b>erelAsAdmin (2)</b>—Setup.exe requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator.</li> </ul> <p>For more information, see <a href="#">Minimizing the Number of User Account Control Prompts During Installation</a>.</p> |
| <b>SetupCmdLine</b>           | InstallScript, InstallScript Object         | Read-Write Property | Gets or sets the release's Setup Command Line property, which specifies any command line parameters you want to pass to Setup.exe when the setup is launched.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SetupEXE</b>               | Basic MSI, InstallScript MSI                | Read-Write Property | <p>Set this property to True to create a Setup.exe setup launcher for the current release.</p> <p>The SetupEXE property and the <a href="#">TargetOS property</a> correspond with the Setup Launcher setting on the <a href="#">Setup.exe tab</a> in the Releases view.</p> <p>To learn about scenarios that require a setup launcher, see <a href="#">Creating a Setup Launcher</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Name                             | Project                            | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|------------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SetupPrerequisiteLocation</b> | Basic MSI,<br>InstallScript<br>MSI | Read-Write<br>Property | <p>Gets or sets the location from which InstallShield prerequisites are obtained during the installation. Available values are:</p> <ul style="list-style-type: none"> <li>● <b>0</b>—Stores the InstallShield prerequisite files on the source media. Setting this value overrides the locations specified for each InstallShield prerequisite in the <b>Redistributables</b> view of the InstallShield IDE.<br/><br/>Use this value if the installation is run uncompressed from fixed media, such as a CD, DVD, or local network.</li> <li>● <b>1</b>—Compresses the InstallShield prerequisite files into setup.exe, to be extracted at run time, if necessary. Setting this value overrides the locations specified for each InstallShield prerequisite in the <b>Redistributables</b> view of the InstallShield IDE.<br/><br/>Use this value if the entire installation is required to be self-contained in setup.exe.</li> <li>● <b>2</b>—Downloads all of the InstallShield prerequisite files included in your project (if necessary) from the URL specified in the InstallShield prerequisite (.prq) file for each prerequisite. Setting this value overrides the locations specified for each InstallShield prerequisite in the <b>Redistributables</b> or <b>Prerequisites</b> view of the InstallShield IDE.<br/><br/>This value is recommended if your installation is downloaded from the Internet and you want to minimize the package size and download time. An InstallShield prerequisite will not be downloaded if the correct version is already present on the target machine.</li> </ul> |

| Name                    | Project                                                                         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SignFilesInclude</b> | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | <p>Specify the files and file patterns that you want to be digitally signed at build time. Note the following guidelines:</p> <ul style="list-style-type: none"> <li>To indicate a wild-card character, use an asterisk (*). For example, if you want to sign all .exe files, specify the following:<br/><b>*.exe</b></li> </ul> <p>Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to sign all files that match a certain pattern.</p> <ul style="list-style-type: none"> <li>Put each file and each file pattern on its own line, with each separated by a carriage return.</li> <li>Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify <b>*.exe</b> for the SignFilesInclude property and the SignFilesExclude property, InstallShield does not sign any .exe files.</li> </ul> |
| <b>SignFilesInPlace</b> | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | <p>Specify whether you want InstallShield to sign your original files or just the files that are built into the release:</p> <ul style="list-style-type: none"> <li><b>False</b>—InstallShield signs a temporary copy of each file and then uses that signed temporary copy to build a release. Note that with this behavior, InstallShield will not modify or sign your original files.</li> <li><b>True</b>—If you want InstallShield to sign your original files, set this property to True.</li> </ul> <p>The default value of this property is set to False.</p> <p>The benefit of specifying True for a Basic MSI or InstallScript MSI project is that it helps create one patch that updates both compressed and uncompressed versions of a release that contains originally unsigned files.</p>                                                                                                                                                       |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name                | Project                                                                         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|---------------------------------------------------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SigningType</b>  | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | <p>Gets or sets the method to digitally sign the build-generated files. Use the following options to set this property:</p> <ul style="list-style-type: none"> <li>● <b>eesBuiltIn (0)</b>—Use this value to select the standard method in which the default InstallShield sign tool is used to digitally sign build-generated files.</li> <li>● <b>eesCustom (1)</b>—Use this value to select the custom method in which a customized sign tool is used to digitally sign build-generated files.</li> </ul> <div>  <p><b>Note</b> ■ By default, the value of the <b>SigningType</b> property is <b>eesBuiltIn (0)</b> to select the standard method.</p> </div> |
| <b>SignLauncher</b> | Basic MSI, InstallScript MSI                                                    | Read-Write Property | Set this property to True to digitally sign your Setup.exe file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SignMedia</b>    | This varies. (To learn more, see <a href="#">SignMedia.</a> )                   | Read-Write Property | Set this property to indicate whether to digitally sign your media, and if so, which files should be signed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name                     | Project                                                                         | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|---------------------------------------------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SignSignedFiles</b>   | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | <p>If any of the files in your project are already digitally signed, specify whether you want InstallShield to replace those existing digital signatures with the digital signature that you specify through the DigitalCertificateInfo property:</p> <ul style="list-style-type: none"> <li>● <b>True</b>—Use the digital signature information that you are providing through the DigitalCertificateInfo property instead of any existing digital signature information that is already included with the file.</li> <li>● <b>False</b>—Leave the existing digital signature information intact for any files that are already signed. This is the default value.</li> </ul> <p>Note that this affects only files that meet the requirements that are specified in the SignFilesInclude and SignFilesExclude properties.</p> |
| <b>SingleEXEFileName</b> | InstallScript, InstallScript Object                                             | Read-Write Property | Gets or sets the release's Single Exe File Name setting, which specifies the file name (including extension) of a self-extracting executable file that runs the installation. If the property's value is null, no self-extracting executable file is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SingleEXEIconName</b> | InstallScript, InstallScript Object                                             | Read-Write Property | Gets or sets the release's Single Exe Icon File setting, which specifies the fully qualified name of the file from which the executable file's icon is taken at build time. If the property's value is null, a default icon is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>SkinName</b>          | InstallScript, InstallScript Object                                             | Read-Write Property | Gets or sets the release's Specify Skin setting, which specifies the dialog box skin that is applied to this release. This property is applicable only if the UseProjectSkin property is set to True.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>UpdateSettingsOnAppLaunch</b> | Basic MSI                                                        | Read-Write Property | <p>Set this property to True if you want to configure the update properties for the MSIX package during app launch by setting the MsixHoursBetweenUpdateCheck, MsixShowPrompt, and MsixUpdateBlocksActivation properties.</p> <p>Set this property to False if you don't want to configure the update properties for the MSIX package during app launch.</p>                                                                                                                                                                                                           |
| <b>URLForYourFiles</b>           | Basic MSI, InstallScript MSI                                     | Read-Write Property | <p>Specifies the directory from where your data cabinet files will be downloaded. This property accepts a URL in the form <b>http://www.yourcompany.com/download</b>.</p> <p>This property is used only if the WebType property for the current release is set to ewtDownloader (0) (Downloader) or ewtIFTW (1) (Install from the Web).</p>                                                                                                                                                                                                                            |
| <b>Use64bitSigning</b>           | Basic MSI, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | <p>Set this property to True if you want to use the 64-bit signing framework to digitally sign your package.</p> <p>Set this property to False if you want to use the 32-bit signing framework to digitally sign your package.</p>                                                                                                                                                                                                                                                                                                                                     |
| <b>UseMyVersionInfo</b>          | Basic MSI, InstallScript MSI                                     | Read-Write Property | <p>Set this property to True to override the default InstallShield copyright information, file description, and file version for the Setup.exe. You can specify your copyright information, file description, and file version in the LauncherCopyright, LauncherFileDescription, and LauncherFileVersion properties respectively.</p> <p>This property is applicable only to releases that meet the following criteria:</p> <ul style="list-style-type: none"> <li>● Single-file Setup.exe</li> <li>● Compressed files</li> <li>● Network image media type</li> </ul> |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                             | Project                                                                         | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|---------------------------------------------------------------------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>UsePathVariableTestValues</b> | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property        | If you used test values for any of your path variables, set this property to True to set those variables to their actual values at this time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>UseProjectSkin</b>            | InstallScript, InstallScript Object                                             | Read-Write Property        | This Boolean property gets or sets whether the release's Specify Skin property is set to Use Project Setting, which uses the skin that is selected in the Dialogs view's Skins folder.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>VMConfig</b>                  | Basic MSI, InstallScript, InstallScript MSI                                     | Read-Write String Property |  <p><b>Edition</b> ■ This property is available in the Premier edition of InstallShield.</p> <p>Gets or sets the name of the group of VM configuration settings that you want to use when distributing the selected release to a VM.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p>                                                                                                                                                 |
| <b>VMMachinePassword</b>         | Basic MSI, InstallScript, InstallScript MSI                                     | Read-Write String Property |  <p><b>Edition</b> ■ This property is available in the Premier edition of InstallShield.</p> <p>If a password is specified for the VM configuration that is selected through the VMConfig property, that password is considered to be the default value for the VMMachinePassword property. To override the password for the selected release, set the VMMachinePassword property.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p> |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name              | Project                                              | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|------------------------------------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VMMachineUserName | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI | Read-Write<br>String Property |  <p><b>Edition</b> ■ This property is available in the Premier edition of InstallShield.</p> <p>If a user name is specified for the VM configuration that is selected through the VMConfig property, that user name is considered to be the default value for the VMMachineUserName property. To override the user name for the selected release, set the VMMachineUserName property.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p>                                                                                                                                                                                                                                                              |
| VMSnapShot        | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI | Read-Write<br>String Property |  <p><b>Edition</b> ■ This property is available in the Premier edition of InstallShield.</p> <p>Optionally gets or sets the name of the snapshot that you want to use for distributing the release.</p> <p>If a snapshot is specified for the VM configuration that is selected through the VMConfig property, the name of that snapshot is considered to be the default value for the VMSnapShot property.</p> <p>If no snapshot is specified for the VM configuration, InstallShield does not revert to a specific snapshot. InstallShield powers on the VM without reverting it to a specific snapshot, and copies your installation to the VM.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p> |

Table 100 ■ ISWiRelease Object Members (cont.)

| Name                          | Project                                              | Type                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|------------------------------------------------------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VMStageMachineCopyPath</b> | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI | Read-Write<br>String Property     |  <p><b>Edition</b> ■ This property is available in the Premier edition of InstallShield.</p> <p>The copy path identifies the location on the VM where the release is to be distributed. The last subfolder in the path can be a path that InstallShield creates on the VM; the other folders in the path must already exist.</p> <p>If a destination path is specified for the VM configuration that is selected through the VMConfig property, that destination path is considered to be the default value for the VMStageMachineCopyPath property. To override the destination path for the selected release, set the VMStageMachineCopyPath property.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p> |
| <b>VMStagePostBuild</b>       | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI | Read-Write<br>Boolean<br>Property |  <p><b>Edition</b> ■ This property is available in the Premier edition of InstallShield.</p> <p>Specify whether you want InstallShield to automatically distribute the selected release each time that it is successfully built. Distributing the release to the VM involves the following tasks:</p> <ol style="list-style-type: none"> <li>1. Revert the VM to the designated snapshot (if one is specified).</li> <li>2. Power on the VM.</li> <li>3. Copy the built release to the VM to make it available for testing.</li> </ol> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p>                                                                                                                     |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name                        | Project       | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|---------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WebCreateDefaultPage</b> | InstallScript | Read-Write Property | This Boolean property gets or sets the release's Create Default Web Page setting, which specifies whether InstallShield should create a default Web page (.htm file) and place it in the Disk1 folder.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>WebPageUrl</b>           | InstallScript | Read-Write Property | <p>Gets or sets the release's Web Page URL setting, which specifies the location of the Web page that should be launched if you click the Run From Web command on the Build menu in InstallShield:</p> <p>If nothing is entered for this property, InstallShield creates a Setup.htm file at build time and places it in the Disk1 folder.</p> <p>If you do enter a URL for this property, do not include the name of the page, and do not include an ending forward slash. For example, if the full URL for the Setup.htm file is <b>http://www.mypages.com/setup/Setup.htm</b>, enter the following as the Web page URL: <b>http://www.mypages.com/setup</b></p> <p>When you click the Run from Web command on the Build menu, InstallShield launches the appropriate URL (<b>http://www.mypages.com/setup/Setup.htm</b>, in the aforementioned example).</p> |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name           | Project                      | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WebType</b> | Basic MSI, InstallScript MSI | Read-Write Property | <p>Indicates the configuration of your Web installation setup package. Set this property to one of the following:</p> <ul style="list-style-type: none"> <li>● <b>ewtDownloader (0)</b>—Downloader. Builds this release as a combination of Setup.exe and your MSI package, where the end user downloads and launches Setup.exe, which in turn downloads and runs the MSI database, which contains all of your files.</li> <li>● <b>ewtIFTW (1)</b>—Install from the Web. Builds this release as a combination of Setup.exe, your MSI database, and external cabinet (.cab) files. The end user downloads and runs Setup.exe, which in turn downloads and runs the MSI database. Based on the end user's setup type and feature selections, only the requested CAB files are downloaded and installed to minimize download time.<br/><br/>Application maintenance and repair use the URL specified in the URLForYourFiles property as the installation source.</li> <li>● <b>ewtOneExe (2)</b>—One executable. Builds this release as a single self-extracting Setup.exe. This setting is ideal for a package that is to be downloaded from many Web or FTP sites, since the installation package is self-contained. Note that the entire installation package is downloaded, so the download time is greater than the ewtIFTW (1) (Install from the Web) setting.</li> </ul> |

**Table 100** ■ ISWiRelease Object Members (cont.)

| Name                     | Project                      | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WindowsAppPackage</b> | Basic MSI                    | Read-Write Property | <p>Set this property to True if you want a Windows app package (.appx/.msix) to be built as part of the release build process. A Windows app package is required to build for the following desired scenarios:</p> <ul style="list-style-type: none"> <li>• Distribute your app through the Windows Store.</li> <li>• Target Windows Server Nano.</li> <li>• Sideload a Appx/MSIX that leverages the Universal Windows Platform.</li> </ul> <p>Set this property to False if you do not want a Windows app package (.appx/.msix) to be built as part of the release build process. If you set this property value to False, only the .msi package is allowed to build.</p> |
| <b>WrapMSIIntoCab</b>    | Basic MSI, InstallScript MSI | Read-Write Property | <p>Specifies whether to place the release's MSI database inside a cabinet (.cab) file.</p> <p>This property applies only if the WebType property for the current release is set to ewtDownloader (0) (Downloader).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Example

The following lines of Visual Basic demonstrate opening a project and showing a message box of several of a release's properties:

```
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\Commercial.ism", True

Dim pProdConfig As ISWiProductConfig
Set pProdConfig = pProject.ISWiProductConfigs.Item("Version 1")
' In an InstallScript project, there is only one element
' in ISWiProductConfigs, which is named "Media".

Dim pRelease As ISWiRelease
Set pRelease = pProdConfig.ISWiReleases.Item("NewRelease1")

Dim sProps As String
sProps = pRelease.Name & " has these properties:" & vbNewLine
sProps = sProps & "Build Location: " & pRelease.BuildLocation & vbNewLine
sProps = sProps & "Compressed: " & pRelease.Compressed & vbNewLine
sProps = sProps & "Default Language: " & pRelease.DefaultLang & vbNewLine
sProps = sProps & "Setup.exe: " & pRelease.SetupEXE
```

MsgBox sProps

pProject.CloseProject

## Build Status Events

The ISWiRelease object raises the following status events:

- Public Event ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
- Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
- Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)

These events are raised during the build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see [Using Build Status Events](#).

## Build Method

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the Build method to build the current release. This is a full and complete rebuild of your release.

### Syntax

Build()

### Applies To

- [ISWiRelease](#)

## BuildTablesOnly Method

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

Call the BuildTablesOnly method to build only the Windows Installer tables of the current release.

**Note** ▪ If you have not built this setup already, a new .msi file is created, but no files are added to your setup. If you have built your setup already, the .msi file is updated when all the tables are built, but no files are transferred.

## Syntax

BuildTablesOnly ()

## Applies To

- ISWiRelease

## BuildTablesRefreshFiles Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the BuildTablesOnly method to rebuild your MSI file and update the Files table, including any new or changed files in your installation.

**Note** ▪ Changed files are updated only if the size or time stamp differs from the copy already included in the build. References to deleted files are removed from the setup, but the file remains in the build location. This type of build can be run only after a complete build has been performed, and it works only when the media is an uncompressed network image.

## Syntax

BuildTablesRefreshFiles ()

## Applies To

- ISWiRelease

## CubFile Property

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

CubFile is a read-write property which you must specify prior to ISWiRelease.Build. This is a build option which is the same as building a release at the command line using ISCmdBld.exe.

The string parameter associated with this property is .cub file name.

## Applies To

- ISWiRelease

## SignMedia Property

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- Merge Module

*Project-specific differences are noted where appropriate.*

The ISWiRelease.SignMedia property enables you to indicate whether to digitally sign your media, and if so, which files should be signed.

The following table lists the four states that can be assigned or retrieved from the ISWiRelease.SignMedia property.

**Table 101** ▪ ISWiRelease.SignMedia Property Values

| Return Value          | Type                | Description                                                                                                                                                                                                         |
|-----------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>esBoth (3)</b>     | Read-Write Property | For Basic MSI and InstallScript MSI projects: Sign the Windows Installer package (.msi file) and Setup.exe.<br><br>For InstallScript projects: Sign both the media header file (Data1.hdr) and Setup.exe.           |
| <b>esMsi (2)</b>      | Read-Write Property | For Basic MSI, InstallScript MSI, and Merge Module projects: Digitally sign only the Windows Installer package (.msi file or .msm file).<br><br>For InstallScript projects: Sign the media header file (Data1.hdr). |
| <b>esNone (4)</b>     | Read-Write Property | For Basic MSI, InstallScript, and InstallScript MSI projects: None of the media files (Setup.exe, Windows Installer package, or the header file) are signed at build time.                                          |
| <b>esSetupExe (1)</b> | Read-Write Property | For Basic MSI, InstallScript, and InstallScript MSI projects: Digitally sign only Setup.exe.                                                                                                                        |

## Applies To

- ISWiRelease Object

# ISWiRemoveFile Object

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiRemoveFile represents a file or folder removal entry in the InstallShield user interface. To retrieve a file or folder removal entry, specify an item in the ISWiRemoveFiles collection.

## Members

**Table 102** - ISWiRemoveFile Object Members

| Name        | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FileKey     | Read-Write Property | Gets or sets the FileKey property for this file or folder removal entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| FileName    | Read-Write Property | Gets or sets the FileName property for this file or folder removal entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DirProperty | Read-Write Property | Gets or sets the DirProperty property for this file or folder removal entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| InstallMode | Read-Write Property | <p>Gets or sets the InstallMode property for this file or folder removal entry. Specify one of the following types:</p> <ul style="list-style-type: none"><li>• <b>erfimOnInstall (1)</b>—Remove the file or folder only when the associated component is being installed.</li><li>• <b>erfimOnUninstall (2)</b>—Remove the file or folder only when the associated component is being removed.</li><li>• <b>erfimOnBoth (3)</b>—Remove the file or folder when the associated component is being installed or removed.</li></ul> |

# ISWiSequenceRecord Object

**Project** - This information applies to the following project types:

- Basic MSI

- *InstallScript MSI*

ISWiSequenceRecord represents an action in the Custom Actions and Sequences view of the InstallShield user interface.

## Members

**Table 103** ■ ISWiSequenceRecord Object Members

| Name             | Type                | Description                                                |
|------------------|---------------------|------------------------------------------------------------|
| <b>Name</b>      | Read-Write Property | Holds the string name of the specified action.             |
| <b>Comment</b>   | Read-Write Property | Gets or sets comments for the specified action.            |
| <b>Condition</b> | Read-Write Property | Gets or sets the condition for the specified action.       |
| <b>Sequence</b>  | Read-Write Property | Gets or sets the sequence number for the specified action. |

## Example

The following VBScript code displays the sequence number of the LaunchConditions action in the project's Installation User Interface sequence.

```
Set oISM = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")

oISM.OpenProject "C:\MySetups\MyProject.ism", True ' open read-only

Set oSequenceRecord = oISM.InstallUISequence("LaunchConditions")

MsgBox "LaunchConditions is at sequence number " & oSequenceRecord.Sequence

oISM.CloseProject
```

## Applies To

- *ISWiSequence*

## ISWiSetupFile Object

**Project** ■ This information applies to the following project types:

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

ISWiSetupFile represents a support file in your project. The support file can be an existing one from the Support Files view (or the Support Files/Billboards view) in InstallShield or one that is added by calling [AddSetupFile](#).

Use the project's [ISWiSetupFiles](#) collection to access a specific support file. You must specify either an index number or the file key for the Item property of ISWiSetupFiles.

## Members

**Table 104** ■ ISWiSetupFile Object Members

| Name            | Type                | Description                                                                                                                                                                                                                                   |
|-----------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FileName</b> | Read-Only Property  | Gets the name of the support file (without the path).                                                                                                                                                                                         |
| <b>Language</b> | Read-Write Property | Gets the string that identifies the language identifier for the support file; for example:<br><br><code>m_pFile.Language = "1033"</code>                                                                                                      |
| <b>Path</b>     | Read-Only Property  | Gets the fully qualified path (including the file name) of the support file's source location. Any path variables are resolved to the actual path.                                                                                            |
| <b>Splash</b>   | Read-Write Property | Specifies whether this support file is a splash screen (True) or not (False).                                                                                                                                                                 |
| <b>Target</b>   | Read-Write Property | Gets or sets the support file's target directory within SUPPORTDIR. The following line specifies the support file to be stored in the MyFolder1\MyFolder2 folder under SUPPORTDIR:<br><br><code>m_pFile.Target = "MyFolder1\MyFolder2"</code> |

## Example

The file key is visible in the IDE only as the first entry in the Direct Editor view's ISSetupFile table. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISWiSetupFile

For Each pSetupFile In pProj.ISWiSetupFiles
    If UCase(pSetupFile.FileName) = "MYSUPPORTFILE.EXT" Then
        Exit For
    End If
Next

pProj.SaveProject
pProj.CloseProject
```

If the file name MySupportFile.ext is found among the project's setup files, the For loop ends, and pSetupFile holds a copy of the ISWiSetupFile object for MySupportFile.ext.

## ISWiSetupType Object

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript MSI*

ISWiSetupType represents a setup type belonging to your project. The setup type can be an existing one from the Setup Types view in the InstallShield user interface or one added by calling [AddSetupType](#).

Use the project's [ISWiSetupTypes](#) collection to access a specific setup type. You must specify either an index number or the setup type name for the Item property of ISWiSetupFiles. The setup type name is visible in the IDE in the Setup Types view's tree control.

### Members

**Table 105** ▪ ISWiSetupType Object Members

| Name               | Type                | Description                                                                                                                                                                              |
|--------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>        | Read-Only Property  | Stores the name of the setup type.                                                                                                                                                       |
| <b>Description</b> | Read-Write Property | This string property specifies the setup type's description. (This description is displayed to end users during the installation process only if you call SdSetupTypeEx in your script.) |
| <b>DisplayName</b> | Read-Write Property | This string property specifies the name of this setup type as you would like it displayed to your users.                                                                                 |

### Example

The following Visual Basic code illustrates how you would set a property for a specific setup type:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupType As ISWiSetupType

Set pSetupType = pProj.ISWiSetupTypes("CSSaveSpace")
pSetupType.DisplayName = "Client Setup - Save Space"

pProj.SaveProject
pProj.CloseProject
```

## ISWiShellProperty Object

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

The ISWiShellProperty object represents a shortcut property that you want the Windows Shell to set. The properties that the Shell can set are defined in propkey.h, which is part of the Windows SDK.

Members

Table 106 ▪ ISWiShellProperty Object Members

| Name          | Type                | Description                                                                                                                                                                                                                                             |
|---------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name          | Read-Write Property | Retrieves or sets the primary key name for a Shell property that is specified in the MsiShortcutProperty table.                                                                                                                                         |
| PropertyName  | Read-Write Property | Retrieves or sets a Shell property. The properties are defined in propkey.h, which is part of the Windows SDK.<br><br>PropertyName typically consists of a GUID and a property ID; for example:<br><br><b>{9F4C2855-9F79-4B39-A8D0-E1D42DE1D5F3}, 9</b> |
| PropertyValue | Read-Write Property | Retrieves or sets a string value for the property.                                                                                                                                                                                                      |

ISWiShortcut Object

**Project ▪** This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

*Project-specific differences are noted where appropriate.*

The ISWiShortcut object represents a shortcut in the Shortcuts explorer. The shortcut can be an existing item in an [ISWiShortcuts](#) collection or one you just created by calling [AddShortcut](#).

Use this object's properties to set the shortcut's attributes in much the same manner as you would in the IDE.

## Members

| Name                       | Project                                                            | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|--------------------------------------------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddShellProperty</b>    | Basic MSI,<br>InstallScript MSI,<br>Merge Module                   | Method                 | Adds a Shell property for the current shortcut object.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Arguments</b>           | Basic MSI,<br>InstallScript,<br>InstallScript MSI,<br>Merge Module | Read-Write<br>Property | Gets or sets the command-line arguments that will be passed to the target file. You can substitute "%1" for the file name. The following statement might launch the target file in silent mode:<br><br><code>m_pShortcut.Arguments = "-s"</code>                                                                                                                                                          |
| <b>DeleteShellProperty</b> | Basic MSI,<br>InstallScript MSI,<br>Merge Module                   | Method                 | Deletes the specified Shell property from the current shortcut object.                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | Basic MSI,<br>InstallScript,<br>InstallScript MSI,<br>Merge Module | Read-Write<br>Property | Contains any descriptive text you have entered for this shortcut. The description is displayed as a tooltip. If this property uses a string entry, Description gives you the value for the string entry identified by the ActiveLanguage property of <a href="#">ISWiProject</a> .                                                                                                                        |
| <b>DisplayName</b>         | Basic MSI,<br>InstallScript,<br>InstallScript MSI,<br>Merge Module | Read-Write<br>Property | Contains the display name you have entered for this shortcut. This name is a localizable value that will be used for the shortcut's name when it is installed instead of the name that identifies the shortcut in the Shortcuts explorer. If this property uses a string entry, DisplayName gives you the value for the string identified by the ActiveLanguage property of <a href="#">ISWiProject</a> . |

**Table 107** ■ ISWiShortcut Object Members (cont.)

| Name                       | Project                                                            | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|--------------------------------------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DoNotHighlightAsNew</b> | Basic MSI,<br>InstallScript,<br>InstallScript MSI,<br>Merge Module | Read-Write<br>Property | <p>Gets or sets a Boolean property that indicates whether the shortcut is configured to be highlighted on the Start menu as new after end users install the product. This has the same effect as clearing the <b>Highlight newly installed programs</b> check box in the Customize Start Menu dialog box for an individual item on a target system.</p> <p>To prevent the Start menu shortcut from being highlighted as newly installed, set this Boolean property to True. To enable the shortcut to be highlighted, set this Boolean property to False.</p> <p>For more information about this highlight functionality, see <a href="#">Preventing a Shortcut on the Start Menu from Being Highlighted as Newly Installed</a>.</p> |
| <b>EnableWin8StartPin</b>  | Basic MSI,<br>InstallScript,<br>InstallScript MSI,<br>Merge Module | Read-Write<br>Property | <p>Gets or sets a Boolean property that indicates whether the shortcut is configured to be pinned by default to the Start screen on Windows 8 target systems.</p> <p>To pin the shortcut by default, set this Boolean property to True. To disable pinning, set this Boolean property to False.</p> <p>For more information about this pinning functionality, see <a href="#">Suppressing Initial Pinning of a Shortcut to the Windows 8 Start Screen</a>.</p>                                                                                                                                                                                                                                                                       |
| <b>HotKey</b>              | Basic MSI,<br>InstallScript,<br>InstallScript MSI,<br>Merge Module | Read-Write<br>Property | Stores the accelerator key for this shortcut as a Long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 107** ■ ISWiShortcut Object Members (cont.)

| Name                       | Project                                                            | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IconFile</b>            | Basic MSI,<br>InstallScript,<br>InstallScript MSI,<br>Merge Module | Read-Write<br>Property | <p>Enter the fully qualified path to the file that contains the icon for this shortcut. You must specify either an executable file that contains the icon resource or an .ico file. (Windows Installer based projects only:) If you leave this property blank, the key file of the component will automatically be set as the shortcut's icon.</p> <p>Because Windows Installer requires a separate icon when the component is advertised, InstallShield extracts the icon from the executable you specify. You must set the IconIndex property if there is more than one icon resource in the executable.</p> |
| <b>IconIndex</b>           | Basic MSI,<br>InstallScript,<br>InstallScript MSI,<br>Merge Module | Read-Write<br>Property | <p>Contains the index for the specified icon as a Long if there is more than one icon resource in IconFile.</p> <p>A nonnegative integer refers to the order of the icon resources in the executable. For example, 0 is for the first icon in the file, 1 for the second, 2 for the third, and so on. Use a negative number to refer to a specific resource ID. For example, the icon index -12 points to the icon with a resource ID of 12.</p>                                                                                                                                                               |
| <b>InternetShortcut</b>    | InstallScript                                                      | Read-Write<br>Property | Gets or sets the Internet Shortcut property for this shortcut, which specifies whether the shortcut is an Internet shortcut that points to the Uniform Resource Locator (URL) specified in the shortcut's Target property. This property is Boolean.                                                                                                                                                                                                                                                                                                                                                           |
| <b>ISWiShellProperties</b> | Basic MSI, DIM,<br>InstallScript MSI,<br>Merge Module              | Collection             | Contains all of the Shell properties for the current shortcut object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Name</b>                | Basic MSI,<br>InstallScript,<br>InstallScript MSI,<br>Merge Module | Read-Only<br>Property  | Retrieves the name of the shortcut. This is the same name that appears in the Shortcuts explorer; do not confuse it with the shortcut's Display Name property.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## AddShellProperty Method

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI

- Merge Module

The AddShellProperty method adds a Shell property for the current shortcut object. The properties that the Shell can set are defined in propkey.h, which is part of the Windows SDK.

For more information on setting Shell properties for a shortcut, see [Setting Custom Shell Properties](#).

Syntax

```
Function AddShellProperty (sName As String) As ISWiShellProperty
```

Parameters

Table 108 ▪ AddShellProperty Method Parameters

| Parameter | Description                                                                                 |
|-----------|---------------------------------------------------------------------------------------------|
| sName     | Pass a string to specify the name of a Shell property that you want to add to the shortcut. |

Return Values

The AddShellProperty method returns an ISWiShellProperty object.

Example

The following sample VBScript snippet adds a Shell property to a shortcut:

```
Dim pShellProperty As ISWiShellProperty
Set pShellProperty = pShortcut.AddShellProperty("MyShellProperty")
```

Applies To

- ISWiShortcut

DeleteShellProperty Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The DeleteShellProperty method deletes the specified Shell property from the current shortcut object.

For more information on setting Shell properties for a shortcut, see [Setting Custom Shell Properties](#).

## Syntax

DeleteShellProperty (pShellProp As ISWiShellProperty) As Long

## Parameters

**Table 109** - DeleteShellProperty Method Parameters

| Parameter         | Description                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------|
| <b>pShellProp</b> | Pass the ISWiShellProperty object to specify a Shell property that you want to remove from a shortcut. |

## Example

The following sample VBScript snippet deletes all of the Shell properties from a shortcut:

```
Dim pShellProperty As ISWiShellProperty
For Each pShellProperty In pShortcut.ISWiShellProperties
    pShortcut.DeleteShellProperty pShellProperty
Next
```

## Applies To

- [ISWiShortcut](#)

# ISWiSISProperty Object

**Project** - This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

ISWiSISProperty represents a property in the Summary Information Stream. You can retrieve a property by specifying an item in the [ISWiSISProperties](#) collection. The following Summary Information Stream property names are supported:

- Title
- Subject
- Author
- Keywords
- PackageCode

- TemplateSummary
- Comments
- Schema
- RequireAdministrativePrivileges

Several of these properties use string entries, as required by InstallShield. In that case, they contain the value for the string identified by the ActiveLanguage property of [ISWiProject](#).

## Members

**Table 110** ■ ISWiSISProperty Object Members

| Name         | Type                | Description                                                                                                                                                                                         |
|--------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>  | Read-Only Property  | Contains the property's name. Must be one of the existing Summary Information Stream properties listed above.                                                                                       |
| <b>Value</b> | Read-Write Property | Gets or sets the property's value.<br><br>If this property uses a string entry, Value gives you the value for the string identified by the ActiveLanguage property of <a href="#">ISWiProject</a> . |

## Example

The following VBScript example sets the Title to **Windows Installer Setup Package** and RequireAdministrativePrivileges to **No**:

```
Option Explicit
```

```
Dim pProject
Set pProject = CreateObject ("IswiAutoAutomation Interface Version.ISWiProject")

pProject.OpenProject "C:\MySetups\SampleProject.ism"

Dim pTitle, sTitle
sTitle = "Windows Installer Setup Package"

Set pTitle = pProject.ISWiSISProperties.Item("Title")
pTitle.Value = sTitle

Dim pReqAdminPriv, sReqAdminPriv
sReqAdminPriv = "No"

set pReqAdminPriv = pProject.ISWiSISProperties.Item("RequireAdministrativePrivileges")
pReqAdminPriv.Value = sReqAdminPriv

pProject.SaveProject
pProject.CloseProject
```

## ISWiSQLConnection Object

---

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

ISWiSQLConnection represents a SQL Server connection in the SQL Scripts view of the InstallShield interface. You can retrieve an ISWiSQLConnection object by using the [ISWiSQLConnections](#) collection.

## Members

**Table 111** ▪ ISWiSQLConnection Object Members

| Name                     | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddSQLRequirement</b> | Method              | Call the AddSQLRequirement method to target specific server versions and determine whether the SQL Server meets your application's minimum requirements.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>AddSQLScript</b>      | Method              | <p>Call the AddSQLScript method to add a new script file to a SQL connection.</p>  <p><b>Note</b> ▪ The AddSQLScript method generates the ISSQLScriptFile table key with a name such as SQLScript1, SQLScript2, or SQLScript3. If you have multiple SQL script files in your project, it may be difficult to distinguish one from the other with this naming convention. Therefore, if you want to be able to specify the key, use the <b>AddSQLScriptEx</b> method.</p> |
| <b>AddSQLScriptEx</b>    | Method              | Call the AddSQLScriptEx method to add a new script file to a SQL connection, and generate a valid name from the passed string.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Authentication</b>    | Read-Write Property | This string gets or sets the authentication mode when connecting to a SQL Server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Comments</b>          | Read-Write Property | This string property gets or sets any internal comments you want to include within your installation project.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Database</b>          | Read-Write Property | This string gets or sets the database name. At runtime, the installation uses this as the default database for installing the SQL script files contained in this connection. This value can be a property. Using a property allows you to dynamically set the name of this database at runtime.                                                                                                                                                                                                                                                           |
| <b>DeleteSQLScript</b>   | Method              | Call the DeleteSQLScript method to remove a SQL script file from a SQL Connection in the InstallShield interface.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>GetDatabaseServer</b> | Method              | The GetDatabaseServer method returns an ISWiSQLDatabaseServer object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>InsertSQLScript</b>   | Method              | Call the InsertSQLScript method to insert an existing script file to a SQL Connection in the InstallShield interface.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Name</b>              | Read-Write Property | This string property gets or sets the connection name. Type an internal name used to uniquely identify this connection in the setup project.                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 111** ■ ISWiSQLConnection Object Members (cont.)

| Name                                                   | Type                | Description                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Order</b>                                           | Read-Write Property | This integer property gets or sets the connection order.                                                                                                                                                                                                                                                                                                              |
| <b>Password</b>                                        | Read-Write Property | This string gets or sets the password when you choose to connect to a server using SQL Server authentication.                                                                                                                                                                                                                                                         |
| <b>RemoveSQLRequirement</b>                            | Method              | Removes a specified SQL requirement from the target product.                                                                                                                                                                                                                                                                                                          |
| <b>SelectDatabaseServer(Name As String) As Boolean</b> | Read-Write Property | This string gets or sets the selected database server name. At runtime, the installation will establish a connection and perform specified requirement checks on the designated database servers based on the sequence of the servers as they are listed.                                                                                                             |
| <b>Server</b>                                          | Read-Write Property | This string gets or sets the server name. At runtime, the installation uses this server name to connect to a SQL Server. This server will be used to install the SQL scripts contained within this connection. This value can be a property. Using a property allows you to dynamically set the name of this server at runtime. You must use the [Property] notation. |
| <b>UserName</b>                                        | Read-Write Property | This string gets or sets the user name when you choose to connect to a server using SQL Server authentication.                                                                                                                                                                                                                                                        |

## Applies To

- ISWiProject

## AddSQLRequirement Method

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The AddSQLRequirement adds a SQL requirement to the target product and returns an ISWiSQLRequirement object.

## Syntax

Function AddSQLRequirement() As ISWiSQLRequirement

## Return Values

This method returns ISWiSQLRequirement object.

## Applies To

- [ISWiSQLConnection](#)

## AddSQLScript Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the AddSQLScript method to add a new script file to a SQL connection.

**Note** ▪ The AddSQLScript method generates the ISSQLScriptFile table key with a name such as SQLScript1, SQLScript2, or SQLScript3. If you have multiple SQL script files in your project, it may be difficult to distinguish one from the other with this naming convention. Therefore, if you want to be able to specify the key, use the [AddSQLScriptEx method](#).

## Syntax

Function AddSQLScript() As ISWiSQLScript

## Return Values

This method returns an ISWiSQLScript object.

## Applies To

- [ISWiSQLConnection](#)

## AddSQLScriptEx Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM

- *InstallScript*
- *InstallScript MSI*

Call the AddSQLScriptEx method to add an ISSQLScriptFile entry to a SQL connection. This method generates a valid name from the passed string. The method ensures that the name of the entry that is being added to the ISSQLScriptFile table is unique and less than 47 characters in length.

Syntax

Function AddSQLScriptEx (ByVal sCandidateName As String) As ISWiSQLScript

Parameters

Table 112 ▪ AddSQLScriptEx Method Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sCandidateName | <p>Specifies the name of the script that you want to add to the SQL connection.</p> <p>Note that file names may contain invalid characters or may be too long for the key. However, if you pass a file name in this parameter, the AddSQLScriptEx method creates an entry with a valid key that is based on the file name; the result is the same as if you had added the SQL script to a connection in the SQL Scripts view.</p> <p>If you specify an empty string (""), the AddSQLScriptEx method generates the ISSQLScriptFile table key with a name such as SQLScript1, SQLScript2, or SQLScript3—the same as if the <a href="#">AddSQLScript method</a> was used to add the ISSQLScriptFile entry.</p> |

Return Values

This method returns an ISWiSQLScript object.

Applies To

- [ISWiSQLConnection](#)

DeleteSQLScript Method

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

Call the DeleteSQLScript method to remove a SQL script file from a SQL Connection in the InstallShield interface.

## Syntax

Function DeleteSQLScript(Script As ISWiSQLScript) As Long

## Parameters

**Table 113** ▪ DeleteSQLScript Method Parameters

| Parameter     | Description                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------|
| <b>Script</b> | Specifies the name of the script you want to remove from the SQL connection in the InstallShield interface. |

## Applies To

- [ISWiSQLConnection](#)

## GetDatabaseServer Method

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

Call the GetDatabaseServer method to return an [ISWiSQLDatabaseServer](#) object.

## Syntax

Sub SetPredefinedRequirement(RHS As ISWiSQLServerVersion)

## Return Values

This method returns the [ISWiSQLDatabaseServer](#) object.

## Applies To

- [ISWiSQLConnection](#)

## InsertSQLScript Method

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*

- *InstallScript MSI*

Call the InsertSQLScript method to insert an existing script file to a SQL Connection in the InstallShield interface.

## Syntax

```
Function InsertSQLScript(strScriptPath As String) As ISWiSQLScript
```

## Parameters

**Table 114** ■ InsertSQLScript Method Parameters

| Parameter            | Description                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>strScriptPath</b> | Specifies the path to the script file you want to insert under the SQL Connection in the InstallShield interface. |

## Return Values

This method returns ISWiSQLScript object.

## Applies To

- *ISWiSQLConnection*
- *ISWiSQLDatabaseServer*

## RemoveSQLRequirement Method

**Project** ■ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

The RemoveSQLRequirement method removes a specified SQL requirement from the target product.

## Applies To

- *ISWiSQLConnection*

## ISWiSQLDatabaseServer Object

**Project** ■ This information applies to the following project types:

- *Basic MSI*
- *DIM*

- *InstallScript*
- *InstallScript MSI*

ISWiSQLDatabaseServer represents a database server that you can choose to target by version requirements at run time. You can retrieve an ISWiSQLDatabaseServer object by using the [ISWiSQLDatabaseServers](#) collection.

## Members

**Table 115** ■ ISWiSQLDatabaseServer Object Members

| Name                                                   | Type                | Description                                                                                                                                                                                                                                                                                                                                                           |

| <a href="#">ISWiSQLRequirements</a>                    | Collection          | Returns the collection of ISWiSQLRequirements associated with this connection.                                                                                                                                                                                                                                                                                        |
| <a href="#">ISWiSQLScripts</a>                         | Collection          | Returns the collection of ISWiSQLScripts associated with this connection.                                                                                                                                                                                                                                                                                             |
| <b>Name</b>                                            | Read-Write Property | This string property gets or sets the connection name for the database server.                                                                                                                                                                                                                                                                                        |
| <b>Order</b>                                           | Read-Write Property | This integer property gets or sets the connection order.                                                                                                                                                                                                                                                                                                              |
| <b>Password</b>                                        | Read-Write Property | This string gets or sets the password when you choose to connect to a server using SQL Server authentication.                                                                                                                                                                                                                                                         |
| <b>SelectDatabaseServer(Name As String) As Boolean</b> | Read-Write Property | This string gets or sets the selected database server name. At runtime, the installation will establish a connection and perform specified requirement checks on the designated database servers based on the sequence of the servers as they are listed.                                                                                                             |
| <b>Server</b>                                          | Read-Write Property | This string gets or sets the server name. At runtime, the installation uses this server name to connect to a SQL Server. This server will be used to install the SQL scripts contained within this connection. This value can be a property. Using a property allows you to dynamically set the name of this server at runtime. You must use the [Property] notation. |
| <b>UserName</b>                                        | Read-Write Property | This string gets or sets the user name when you choose to connect to a server using SQL Server authentication.                                                                                                                                                                                                                                                        |

## ISWiSQLReplace Object

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

ISWiSQLReplace allows you to get and set properties in the Text Replacement tab associated with a script file in the InstallShield interface. You can retrieve an ISWiSQLReplace object using the ISWiSQLReplaces collection.

### Members

**Table 116** - ISWiSQLReplace Object Members

| Name                  | Type                | Description                                                                                                                                                                   |
|-----------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>           | Read-Write Property | This string property gets or sets the name of the SQL Script Replacement object.                                                                                              |
| <b>Search</b>         | Read-Write Property | This string property gets or sets the text string you want to find.                                                                                                           |
| <b>Replace</b>        | Read-Write Property | This string property gets or sets the text string with which you want to replace the existing string during text replacement.                                                 |
| <b>MatchWholeWord</b> | Read-Write Property | This is a Boolean property. During installation, this property helps identify only whole-word matches.                                                                        |
| <b>MatchCase</b>      | Read-Write Property | This is a Boolean property. During installation, this property indicates that the case for words found during text replacement must match.                                    |
| <b>ReplaceOnce</b>    | Read-Write Property | This is a Boolean property. During installation, this property indicates that the string you want to search and replace with a different string should be replaced only once. |
| <b>PreserveCase</b>   | Read-Write Property | This is a Boolean property. During installation, this property indicates that case should be preserved during text replacement.                                               |

## ISWiSQLRequirement Object

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

ISWiSQLRequirement represents the requirements property tab for a new SQL connection in the InstallShield interface. You can retrieve the ISWiSQLRequirement object using the ISWiSQLRequirements collection.

### Members

**Table 117** - ISWiSQLRequirement Object Members

| Name                            | Type                | Description                                                                                                                                                            |
|---------------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AnyGreaterServicePack</b>    | Read-Write Property | This is a Boolean property. Gets or sets a limit on the ServicePackLevel requirement.                                                                                  |
| <b>AnyGreaterVersion</b>        | Read-Write Property | This is a Boolean property. Gets or sets a limit on the MajorVersion requirement.                                                                                      |
| <b>Disable</b>                  | Read-Write Property | This Boolean property disables the SQL requirement.                                                                                                                    |
| <b>MajorVersion</b>             | Read-Write Property | This string property gets or sets the MajorVersion requirement.                                                                                                        |
| <b>Name</b>                     | Read-Write Property | This string property gets or sets the name of the SQL Requirement object, which is necessary for determining which SQL Server versions are supported for a connection. |
| <b>ServicePackLevel</b>         | Read-Write Property | This string property gets or sets the ServicePackLevel requirement.                                                                                                    |
| <b>SetPredefinedRequirement</b> | Method              | Configures the requirement from a set of predefined values which the installation author determines.                                                                   |

## SetPredefinedRequirement Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the SetPredefinedRequirement method to specify requirements for adding a SQL connection to your installation project.

### Syntax

```
Sub SetPredefinedRequirement(RHS As ISWiSQLServerVersion)
```

### Constants

The following is a list of constants associated with the ISWiSQLServerVersion object type.

- essv2K
- essv2Ksp1
- essv2Ksp2
- essv2Ksp3
- essv65
- essv65sp1
- essv65sp2
- essv65sp3
- essv65sp4
- essv65sp5
- essv65sp5a
- essv65sp5aUpdate
- essv7
- essv7sp1
- essv7sp2
- essv7sp3
- essv7sp4

### Return Values

This method returns the ISWiSQLRequirement object.

## Applies To

- [ISWiSQLRequirement](#)

## ISWiSQLScript Object

---

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

*Project-specific differences are noted where appropriate.*

ISWiSQLScript represents a SQL script file in the SQL Scripts explorer of the SQL Scripts view in InstallShield. You can retrieve an ISWiSQLScript object by using the [ISWiSQLScripts collection](#).

## Members

**Table 118** ■ ISWiSQLScript Object Members

| Name                           | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddSQLScriptError</b>       | Method              | Creates and returns <b>ISWiSQLScriptError</b> objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>AddSQLScriptReplacement</b> | Method              | Creates and returns <b>ISWiSQLReplace</b> objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Comments</b>                | Read-Write Property | This string property gets or sets any internal comments you want to include within your installation project. You can enter any notes regarding the script. These notes will be saved and used only within the installation project.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Component</b>               | Read-Write Property | This string property gets or sets the name of the component which is associated with the feature that is associated with the SQL script object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Condition</b>               | Read-Write Property |  <p><b>Project</b> ■ This property is available for the following project types:</p> <ul style="list-style-type: none"> <li>● <b>Basic MSI</b></li> <li>● <b>DIM</b></li> <li>● <b>InstallScript MSI</b></li> </ul> <p>This property specifies the condition that is evaluated at run time to determine whether the SQL script should be run during installation or uninstallation. If the condition evaluates to true, the script is run.</p> <p>This property corresponds with the condition that is entered in the Script Condition area of the Runtime tab for a SQL script in the SQL Scripts view.</p> |
| <b>DeleteSQLReplace</b>        | Method              | Deletes an <b>ISWiSQLReplace</b> object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>DeleteSQLScriptError</b>    | Method              | Deletes an <b>ISWiSQLScriptError</b> object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ErrorHandling</b>           | Read-Write Property | <p>Gets or sets one of the following values.</p> <ul style="list-style-type: none"> <li>● <b>esehAbort (2)</b>—On error, abort the installation.</li> <li>● <b>esehGotoNextScript (0)</b>—On error, go to the next script.</li> <li>● <b>esehGotoNextStatement (1)</b>—On error, go to the next statement.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                         |

**Table 118** ■ ISWiSQLScript Object Members (cont.)

| Name                       | Type                | Description                                                                                                                                                                                                                               |
|----------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FullPath</b>            | Read-Write Property | This string property gets or sets the path of the .sql file associated with the SQL script object you want to execute by the installation.                                                                                                |
| <b>InstallText</b>         | Read-Write Property | This string property gets or sets the status text when a script is run during install. This status text appears in the status message, which is displayed to the end-user while the script is running.                                    |
| <b>ISWiSQLScriptErrors</b> | Read-Only Property  | Returns the collection of <a href="#">ISWiSQLScriptErrors</a> that are associated with this SQL script.                                                                                                                                   |
| <b>Name</b>                | Read-Write Property | This string property gets or sets the name of the SQL script object that you want to execute by the installation.                                                                                                                         |
| <b>Order</b>               | Read-Write Property | This integer property gets or sets the order of execution of the script file.                                                                                                                                                             |
| <b>RunOnInstall</b>        | Read-Write Property | This Boolean property specifies whether to schedule the execution of the SQL script during installation.                                                                                                                                  |
| <b>RunOnLogon</b>          | Read-Write Property | This Boolean property specifies whether to run the selected SQL script during login. This property corresponds with the Run Script During Login check box on the Runtime tab for a SQL script in the SQL Scripts view.                    |
| <b>RunOnRollback</b>       | Read-Write Property | This Boolean property specifies whether to schedule the execution of the SQL script during rollback. This property corresponds with the Run Script During Rollback check box on the Runtime tab for a SQL script in the SQL Scripts view. |
| <b>RunOnUninstall</b>      | Read-Write Property | This Boolean property specifies whether to schedule the execution of the SQL script during uninstallation.                                                                                                                                |
| <b>UninstallText</b>       | Read-Write Property | This string property gets or sets the status text when a script is run during uninstall. This status text appears in the status message, which is displayed to the end-user while the script is running.                                  |
| <b>Version</b>             | Read-Write Property | This property gets or sets the version number for the SQL script file. For more information, see <a href="#">Specifying a Version Number for a SQL Script File</a> .                                                                      |

## AddSQLScriptError Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the AddSQLScriptError method to add a custom error handling entry to a SQL script.

### Syntax

Function AddSQLScriptError()

### Return Values

This method returns an ISWiSQLScriptError object.

### Applies To

- ISWiSQLScript

## AddSQLScriptReplacement Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the AddSQLScriptReplacement method to specify a string and replace it with a different string in a SQL script file.

### Syntax

Function AddSQLScriptReplacement() As ISWiSQLReplace

### Return Values

This method returns the ISWiSQLReplace object.

### Applies To

- ISWiSQLScript

## DeleteSQLReplace Method

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the DeleteSQLReplace method to remove a text replacement entry that you have added.

### Syntax

Function DeleteSQLReplace(Replace As ISWiSQLReplace) As Long

### Applies To

- ISWiSQLScript

## DeleteSQLScriptError Method

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the DeleteSQLScriptError method to remove a custom error handling entry that you have added.

### Syntax

Function DeleteSQLScriptError(ByVal pScriptError As ISWiSQLScriptError)

### Applies To

- ISWiSQLScript

## ISWiSQLScriptError Object

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

ISWiSQLScriptError represents a custom error handling entry for a SQL script file in the SQL Scripts view in InstallShield. You can retrieve an ISWiSQLScriptError object by using the [ISWiSQLScriptErrors collection](#).

**Table 119** ■ ISWiSQLScriptError Object Members

| Name                 | Type                | Description                                                                                                                                                                                                                                                                                                    |
|----------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ErrorHandling</b> | Read-Write Property | Gets or sets one of the following values. <ul style="list-style-type: none"> <li>● <b>esehAbort (2)</b>—On error, abort the installation.</li> <li>● <b>esehGotoNextScript (0)</b>—On error, go to the next script.</li> <li>● <b>esehGotoNextStatement (1)</b>—On error, go to the next statement.</li> </ul> |
| <b>ErrorNumber</b>   | Read-Write Property | Gets or sets a numeric value that indicates the SQL error number for which you want to customize error handling.                                                                                                                                                                                               |

## ISWiStringEntry Object

**Project** ■ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The ISWiStringEntry object represents a string entry for a specific language.

Members

Table 120 ▪ ISWiStringEntry Object Members

| Name    | Type                | Description                                                                                                                           |
|---------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Id      | Read-Write Property | Gets or sets the language-independent identifier for the string. Each string identifier in a project is linked to one or more values. |
| Value   | Read-Write Property | Gets or sets the run-time string.                                                                                                     |
| Comment | Read-Write Property | Gets or sets an internal note about the string entry.                                                                                 |

ISWiUpgradeTableEntry Object

**Project ▪** This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

ISWiUpgradeTableEntry represents an upgrade item in the Upgrades view of InstallShield. You can retrieve an upgrade item by specifying an item in the [ISWiUpgradeTableEntries collection](#).

## Members

**Table 121** ▪ ISWiUpgradeTableEntry Object Members

| Name                  | Type                | Description                                                                                                                                                                                                                       |
|-----------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Delete</b>         | Method              | Deletes the StaticUpgradeEntry from the project file.                                                                                                                                                                             |
| <b>DisplayName</b>    | Read-Write Property | Gets or sets the name of the upgrade entry. This is the internal name that is displayed for an upgrade item in the Upgrades view.                                                                                                 |
| <b>UpgradeCode</b>    | Read-Write Property | Gets or sets the upgrade table entry's Upgrade Code. The upgrade code is a GUID representing a related set of products. It is used in the Upgrade Table to search for related versions of the product that are already installed. |
| <b>VersionMin</b>     | Read-Write Property | Specifies the lower bound of the range of product versions detected by FindRelatedProducts.                                                                                                                                       |
| <b>VersionMax</b>     | Read-Write Property | Specifies the upper boundary of the range of product versions detected by FindRelatedProducts.                                                                                                                                    |
| <b>Language</b>       | Read-Write Property | Specifies the set of languages detected by FindRelatedProducts. Enter a list of numeric language identifiers (LANGID) separated by commas.                                                                                        |
| <b>Attributes</b>     | Read-Write Property | Contains the bit flags specifying attributes of the Upgrade table.                                                                                                                                                                |
| <b>Remove</b>         | Read-Write Property | The formatted string entered for this property must evaluate to a comma-delimited list of feature names.                                                                                                                          |
| <b>ActionProperty</b> | Read-Write Property | When the FindRelatedProducts action detects a related product installed on the system, it appends the product code to the property specified in this field.                                                                       |

## Applies To

- ISWiProject

## Delete Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the Delete method to remove the StaticUpgradeEntry from the project file.

## Syntax

Delete()

## Applies To

- ISWiUpgradeTableEntry

# Automation Collections

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Each InstallShield automation collection is a set of objects. For example, the ISWiFeatures collection is a set of ISWiFeature objects in the current project. This section describes each of the InstallShield automation collections.

## ISWiAdvancedFiles Collection

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

ISWiAdvancedFiles is a collection that contains every advanced file (as an [ISWiAdvancedFile](#) object) in your project. For example, the following Visual Basic code illustrates how you would set a property for a specific advanced file:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiAdvancedFiles(1).Disk = edtOther

pProj.SaveProject
pProj.CloseProject
```

## Members

**Table 122** ▪ ISWiAdvancedFiles Collection Members

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of advanced files in the ISWiAdvancedFiles collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the advanced file to retrieve the <b>ISWiAdvancedFile</b> object. For example, the following statements create references to the first advanced file in the collection and the advanced file named CSSaveSpace:</p> <pre>Set pSetupFile1 = pProj.ISWiAdvancedFiles.Item(1) Set pSetupFile2 = pProj.ISWiAdvancedFiles.Item("CSSaveSpace")</pre> <p>Item is the default property for ISWiAdvancedFiles, which means that <code>pProj.ISWiAdvancedFiles.Item("CSSaveSpace")</code> is equivalent to <code>pProj.ISWiAdvancedFiles("CSSaveSpace")</code>.</p> |

## Applies To

- **ISWiProject**

## ISWiAutomaticUpgradeEntries Collection

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

ISWiAutomaticUpgradeEntries returns a collection of **ISWiAutomaticUpgradeEntry** items as they are defined in the IDE.

## Members

**Table 123** ■ ISWiAutomaticUpgradeEntries Collection Members

| Property     | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiAutomaticUpgradeEntries collection.                                                                                                                                                                                                                                                                                                          |
| <b>Item</b>  | Read-Only Property | Provide the index number or upgrade code in order to retrieve the ISWiAutomaticUpgradeEntries items.<br><br>Item is the default property for ISWiAutomaticUpgradeEntries, which means that <code>m_ISWiProject.ISWiAutomaticUpgradeEntries.Item("12345678-1234-1234-1234-123456789012")</code> is equivalent to <code>m_ISWiProject.ISWiAutomaticUpgradeEntries("12345678-1234-1234-1234-123456789012")</code> . |

## Example

```
Dim m_ISWiProj As ISWiProject
Dim m_AutomaticUpgradeEntries As ISWiAutomaticUpgradeEntries

Set m_ISWiProj = New ISWiProject
m_ISWiProj.OpenProject "C:\mysetups\build 34.ism"

For Each m_AutomaticUpgradeEntries In m_ISWiProject.ISWiAutomaticUpgradeEntries
    m_AutomaticUpgradeEntries.Name = "Upgrade Msi Item1"
Next

m_ISWiProj.SaveProject
m_ISWiProj.CloseProject
```

The following line illustrates how to access a particular automatic upgrade entry:

```
Set m_AutomaticUpgradeEntries = ISWiProject.ISWiAutomaticUpgradeEntries ("Upgrade Msi Item1")
```

## Applies To

- ISWiProject

## ISWiChainPackageDatas Collection

**Project** ■ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Contains collection of data pertaining to all chained.msi packages in the current project

## Members

**Table 124** ■ ISWiChainPackageDatas Collection Members

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiChainPackageDatas collection.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the chained.msi package in order to retrieve the <a href="#">ISWiChainPackageData Object</a>.</p> <p>The name of the chained.msi package is case-sensitive—"Chain Package One" and "Chain Package one" are two different configurations.</p> <p>Item is the default property for ISWiChainPackageDatas Ccollection, which means that pProject.ISWiChainPackageDatas.Item("PackageData1") is equivalent to pProject.ISWiChainPackageDatas ("PackageData1").</p> |

## Example

The VBScript example below displays that how to retrieve data pertaining to a specific chained .msi package in the project:

```
Set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\MyProject.ism", True ' open read-only

sNames = "This project contains the following:" & vbNewLine
iCount = pProject.ISWiChainPackages.Count
For i = 1 to iCount
    Set pChainPackage = pProject.ISWiChainPackages.Item(i)
    sNames = sNames & vbTab & pChainPackage.DisplayName & vbNewLine
    sNames = sNames & vbTab & "This project chain package contains the following files and folder:"
    & vbNewLine
    iCount2 = pChainPackage.ISWiChainPackageDatas.Count
    For j = 1 to iCount2
        Set pPackageData = pChainPackage.ISWiChainPackageDatas.Item(j)
        sNames = sNames & vbTab & pPackageData.ISBuildSourcePath & vbNewLine
    Next
Next

MsgBox sNames
```

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiComponents collection.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the component in order to retrieve the <a href="#">ISWiComponent</a> object.</p> <p>The name of the component is case-sensitive—for example, “Help_Files” and “Help_files” are two different components.</p> <p>Item is the default property for ISWiComponents, which means that <code>m_ISWiFeature.ISWiComponents.Item("Help_Files")</code> is equivalent to <code>m_ISWiFeature.ISWiComponents("Help_Files")</code>.</p> |

## Examples

The following Visual Basic code opens a project, loops through each component in the feature NewFeature1, sets the RemoteInstallation property for each component to run from source, and finally saves and closes the project.

```
Dim m_ISWiProj As ISWiProject
Dim m_Feature As ISWiFeature
Dim m_Comp As ISWiComponent

Set m_ISWiProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
m_ISWiProj.OpenProject "C:\mysetups\build 34.ism"

Set m_Feature = m_ISWiProj.ISWiFeatures("NewFeature1")

If Not m_Feature Is Nothing Then
    For Each m_Comp In m_Feature.ISWiComponents
        m_Comp.RemoteInstallation = rfsSource
    Next
EndIf
```

```
m_ISWiProj.SaveProject
m_ISWiProj.CloseProject
```

The following line illustrates how to access a particular component:

```
Set m_Comp = m_ISWiProj.ISWiFeatures("MyFeature").ISWiComponents("MyComponent")
```

### Applies To

- ISWiFeature
- ISWiProject

## ISWiComponentSubFolders Collection

---

**Project** ■ This information applies to the following project types:

- InstallScript
- InstallScript Object

ISWiComponentSubFolders is a collection that contains every component subfolder (as an [ISWiComponentSubFolder](#) object) in the current component or component subfolder. For example, the following Visual Basic code illustrates how you would apply a method to a specific component subfolder:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder").AddFile("C:\My Files\MyFile.ext")

pProj.SaveProject
pProj.CloseProject
```

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of component subfolders in the ISWiComponentSubFolders collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the component subfolder to retrieve the <b>ISWiComponentSubFolder</b> object. For example, the following statements create references to the first component subfolder in the collection and the component subfolder named MyCompSubFolder:</p> <pre>Set pComponentSubFolder1 = pProj.ISWiComponentSubFolders.Item(1) Set pComponentSubFolder2 = pFeature.ISWiComponentSubFolders.Item("MyCompSubFolder")</pre> <p>Item is the default property for ISWiComponentSubFolders, which means that<br/> pFeature.ISWiComponentSubFolders.Item("MyCompSubFolder") is equivalent to<br/> pFeature.ISWiComponentSubFolders("MyCompSubFolder").</p> |

## Applies To

- **ISWiComponent**
- **ISWiComponentSubFolder**

## ISWiConditions Collection

**Project** ■ This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

The ISWiConditions collection contains all of the conditions associated with a specified feature. ISWiConditions provides an interface for enumerating all of the conditions in a feature.

## Members

**Table 128** ▪ ISWiConditions Collection Members

| Name         | Type               | Description                                                                                                                                                                                                                                                                                               |
|--------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiConditions collection.                                                                                                                                                                                                                |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number of the condition in order to retrieve the <a href="#">ISWiCondition</a> object.</p> <p>Item is the default property for ISWiConditions, which means that <code>m_ISWiFeature.ISWiConditions.Item(2)</code> is equivalent to <code>m_ISWiFeature.ISWiConditions(2)</code>.</p> |

## Applies To

## ISWiCustomActions Collection

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

The ISWiCustomActions collection contains all of the custom actions in the current project.

The VBScript example below displays a string with each custom action in the project:

```
Set pProject = CreateObject("IsWiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\MyProject.ism", True ' open read-only

sNames = "This project contains the following custom actions:" & vbNewLine

iCount = pProject.ISWiCustomActions.Count
For i = 1 to iCount
    sNames = sNames & vbTab & pProject.ISWiCustomActions(i).Name & vbNewLine
Next

pProject.CloseProject

MsgBox sNames
```

## Members

**Table 129** ▪ ISWiCustomActions Collection Members

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Returns the number of elements in the ISWiCustomActions collection.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the custom action in order to retrieve the <a href="#">ISWiCustomAction</a> object.</p> <p>The name of the custom action is case-sensitive—for example, “MyAction” and “myAction” are two different actions.</p> <p>Item is the default property for ISWiCustomActions, which means that <code>pProject.ISWiCustomActions.Item("Action1")</code> is equivalent to <code>pProject.ISWiCustomActions("Action1")</code>.</p> |

## ISWiDynamicFileLinkings Collection

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

*Project-specific differences are noted where appropriate.*

The ISWiDynamicFileLinkings collection contains all of the dynamic file links that are associated with a specified component.

## Members

**Table 130** ▪ ISWiDynamicFileLinkings Collection Members

| Name         | Type               | Description                                                                                                                      |
|--------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of dynamic file links in the ISWiDynamicFileLinkings collection.                    |
| <b>Item</b>  | Read-Only Property | Provide the index number or name of the dynamically linked folder to retrieve the <a href="#">ISWiDynamicFileLinking</a> object. |

## Applies To

- [ISWiComponent](#)

## ISWiEnvironmentVars Collection

**Project** ▪ The ISWiEnvironmentVars collection applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISWiEnvironmentVars collection contains all of the environment variables that are associated with a specified component.

## Members

**Table 131** ▪ ISWiEnvironmentVars Collection Members

| Name         | Type               | Description                                                                                                             |
|--------------|--------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiEnvironmentVars collection.                         |
| <b>Item</b>  | Read-Only Property | Provide the index number or name of the environment variable to retrieve the <a href="#">ISWiEnvironmentVar</a> object. |

## Applies To

- [ISWiComponent](#)

## ISWiFeatures Collection

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

ISWiFeatures is a collection that contains every feature (as an [ISWiFeature](#) object) in your project.

When ISWiFeatures is a member of [ISWiProject](#), it contains all of the top-level features in the project. To retrieve a collection of subfeatures, access the Features property of the [ISWiFeature](#) object. The result is an ISWiFeatures collection that contains the immediate subfeatures of the current top-level feature. Repeat for further levels of subfeatures.

### Members

**Table 132** ▪ Members of ISWiFeatures Collection

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiFeatures collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the feature to retrieve the <a href="#">ISWiFeature</a> object. For example, the following statements create a copy of the first item in the collection and of the feature named Help_Files:</p> <pre> Set pFeat1 = m_ISWiProject.ISWiFeatures.Item(1) Set pFeat2 = m_ISWiProject.ISWiFeatures.Item("Help_Files") </pre> <p>The name of the feature is case-sensitive—for example, “Help_Files” and “Help_files” are two different features.</p> <p>Item is the default property for ISWiFeatures, which means that</p> <pre> m_ISWiProject.ISWiFeatures.Item("Help_Files") </pre> <p>is equivalent to</p> <pre> m_ISWiProject.ISWiFeatures("Help_Files"). </pre> |

### Example

The following Visual Basic code builds a string with all of the features and components in your project:

```

Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent

```

```

For Each pFeature In m_ISWiProject.ISWiFeatures
    ' Add feature to string
    strProject = strProject & "Feature: " & pFeature.Name & vbNewLine
    strProject = strProject & "Components: "
    For Each pComponent In pFeature.ISWiComponents
        ' Add feature's components to string
        strProject = strProject & pComponent.Name & " "
    Next
    strProject = strProject & vbNewLine
Next

```

## Applies To

- ISWiProject

## ISWiFiles Collection

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The ISWiFiles collection contains all of the files associated with a specified component or, in InstallScript projects, a component subfolder. ISWiFiles contains several read-write properties that allow you to set component properties and file attributes as you would in the IDE.

The following Visual Basic code illustrates how you would set a property for a specific file in a component. For the purposes of this example, assume that the variable m\_oMyComp already has a reference to a component.

```
m_oMYComp.ISWiFiles("F1028_MyFile.dll").Hidden = True
```

|--------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiFiles collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or file key of the file in order to retrieve the <b>ISWiFile</b> object. You cannot use the file name; you must specify the file key. You can view this value in the Direct Editor view (in the File column of the File table) or, in Windows Installer-based projects, the Key column of a component's file list. Be aware that file keys are subject to change when the files are dynamically linked.</p> <p>Item is the default property for ISWiComponents, which means that <code>m_ISWiComponent.ISWiFiles.Item("F1036_MyFile.exe")</code> is equivalent to <code>m_ISWiComponent.ISWiFiles("F1036_MyFile.exe")</code>.</p> |

## Applies To

- **ISWiComponent**

## ISWiFolders Collection

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiFolders contains every program folder belonging to a specified component.

At minimum, each component has the default folders listed below in its ISWiFolders collection. In addition, you could have added a predefined folder to the Shortcuts explorer by right-clicking on Shortcuts and choosing “Show Folder.”

- [TaskBarFolder]
- [SendToFolder]

- [DesktopFolder]

The following code demonstrates accessing the **ISWiFolder** object that represents the taskbar:

```
Dim m_pFolder As ISWiFolder
Set m_pFolder = m_pComponent.ISWiFolders("[TaskBarFolder"])
```

The taskbar, in turn, has subfolders of its own. These subfolders are contained in its SubFolders property, which is itself an ISWiFolders collection. Continuing the example above, you can now create a copy of the object for the Start menu, which is a subfolder of the taskbar in the Shortcuts explorer:

```
Set m_pFolder = m_pFolder.SubFolders("[StartMenuFolder"])
```

We can go ever farther with this example and get a copy of the folder MyProgFolder under the Programs menu:

```
Set m_pFolder = m_pFolder.SubFolders("[ProgramMenuFolder"]).SubFolders("MyProgFolder")
```

ISWiLanguages Collection

**Edition** ■ Support for multilanguage installations is available with InstallShield Premier Edition.

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object

- *Merge Module*

The ISWiLanguages collection contains all of the languages that are included in the current project.

## Members

AddMsiPatchSequence Method

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddMsiPatchSequence method to add a ISWiMsiPatchSequence object to the current patch configuration.

Syntax

AddMsiPatchSequence (FamilyName As String) As ISWiMsiPatchSequence

Parameter

Table 137 - AddMsiPatchSequence Method Parameter

| Parameter  | Description                             |
|------------|-----------------------------------------|
| FamilyName | Holds the family name of patch sequence |

Applies To

- ISWiPatchConfig

DeleteMsiPatchSequence Method

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the DeleteMsiPatchSequence method to remove specified patch sequence from the current patch configuration.

Syntax

DeleteMsiPatchSequence (MsiPatchSequence As ISWiMsiPatchSequence) As Long

Parameter

Table 138 ▪ DeleteMsiPatchSequence Method Parameter

| Parameter        | Description                                    |
|------------------|------------------------------------------------|
| MsiPatchSequence | Holds the patch sequence object to be deleted. |

Applies To

- ISWiPatchConfig

ISWiMsiPatchSequences Collection

**Project ▪** This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Contains all of the patch sequences belonging to the current patch configuration.

Table 139 ▪ ISWiMsiPatchSequences Collection Members

| Name  | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Count | Read-Only Property | Use this property to return the total number of elements in the ISWiMsiPatchSequences collection.                                                                                                                                                                                                                                                                                                                                                                                      |
| Item  | Read-Only Property | <p>Provide the index number or family name of the patch sequence in order to retrieve the ISWiMsiPatchSequences Object.</p> <p>The family name of the patch sequence is case-sensitive—" FamilyName" and "familyname" are two different configurations.</p> <p>Item is the default property for ISWiMsiPatchSequences, which means that pPatchConfig.</p> <p>ISWiMsiPatchSequences.Item("FamilyName ") is equivalent to pPatchConfig.</p> <p>ISWiMsiPatchSequences ("FamilyName").</p> |

# BuildPatch Method

**Project ▪ IswiPatchConfig** *This information applies to the following project types:*

- Basic MSI
- InstallScript MSI

Call BuildPatch to build the patch configuration identified by the current patch object. This action has the same effect as right-clicking on a patch configuration in the Patch Design view and then selecting Build a Patch.

## Syntax

BuildPatch()

## Parameter

**Table 140 ▪** Properties Associated with BuildPatchConfiguration Method

| Property                | Description                                                         |
|-------------------------|---------------------------------------------------------------------|
| PatchConfigErrorCount   | Include the error count associated with a particular patch build.   |
| PatchConfigWarningCount | Include the warning count associated with a particular patch build. |

## Example

The following Visual Basic lines demonstrate this method:

```

'Create the project object
dim pProject
set pProject = CreateObject("IswiAutoAutomation Interface Version.ISwiProject")
'Call the OpenProject method
'#####
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'#####
'pProject.OpenProject("\Your project.ism")
pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-
21.ism")
'Call the OpenProject method
' Get existing configuration
Set oMyConfig = pProject.ISwiProductConfigs.Item("Product Configuration 1")
' Assume project already has release configuration...
Set oNewRelease = oMyConfig.ISwiReleases.Item("Release 1")
' Make sure release setting is uncompressed to build the patch...
oNewRelease.Compressed = False
oNewRelease.SetupEXE = True
' Create and set signing parameters...
Set oMyPatchConfig = pProject.AddPatchConfig("PatchDemo1")
oMyPatchConfig.SignPackage = True
oMyPatchConfig.SignUpdateExe = True
oMyPatchConfig.SignatureSPC = "C:\Users\TestLab\Desktop\Test.pfx"
oMyPatchConfig.SignaturePassword = "XX"
Set oMyLatestImage = oMyPatchConfig.AddUpgradedImage("LatestImg1")
Set oMyPreviousImage = oMyLatestImage.AddTargetImage("PrevImage1")
' Set base image...
oMyPreviousImage.MsiPath = "<ISProjectFolder>BaseImage\PatchDesignInterfaceDemo.msi"
' Set base MSI path to the existing patch configuration
'MyPatchConfig.ISwiUpgradedImages.Item("LatestImg1").ISwiTargetImages.Item("PrevImage1").MsiPath =
"<ISProjectFolder>BaseImage\PatchDesignInterfaceDemo.msi"
pProject.SaveProject
oNewRelease.Build( )
oMyPatchConfig.BuildPatch
MsgBox "Patch Congifuration Config1 build with " & _
    oMyPatchConfig.PatchConfigErrorCount & " Errors and " & _

```

```
oMyPatchConfig.PatchConfigWarningCount & " Warnings"
pProject.CloseProject
```

## ISWiObjects Collection

**Project** - This information applies to the following project types:

- *InstallScript*
- *InstallScript Object*

ISWiObjects is a collection that contains every InstallScript object (as an **ISWiObject** object) in your project. The following Visual Basic code illustrates the use of this collection:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObject = pFeature.ISWiObjects.Item("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```

|--------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiPatchConfigs collection.                                                                                                                                                                                                                                                                                                                                               |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the patch configuration in order to retrieve the <a href="#">ISWiPatchConfig Object</a>.</p> <p>The name of the patch configurations is case-sensitive—"Patch One" and "Patch one" are two different configurations.</p> <p>Item is the default property for ISWiPatchConfigs, which means that pProject.ISWiPatchConfigs.Item("Patch1") is equivalent to pProject.ISWiPatchConfigs ("Patch1").</p> |

## Example

The VBScript example below simply displays a string with each patch configuration in the project:

```
Dim pProject
Set pProject = CreateObject ("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\Vegetarian.ism", True

Dim sNames
sNames = "This project contains the following patch configurations: " & vbNewLine & vbTab

Dim pPatchConfigs
For Each pPatchConfigs In pProject.ISWiPatchConfigs
    sNames = sNames & pPatchConfigs.Name & vbNewLine & vbTab
Next

pProject.CloseProject

WScript.Echo sNames
Object
```

The following line illustrates how to access a particular patch configuration:

```
Set pPatchConfig = pISWiProj.ISWiPatchConfigs.Item("Patch 1.1")
```

## Applies To

- *ISWiLatestSetup*

## AddPatchWholeFile Method

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

Call the AddPatchWholeFile method to add a ISWiPatchWholeFile object to the latest setup item.

## Syntax

```
AddPatchWholeFile (FileKey As String) As ISWiPatchWholeFile
```

## Parameter

**Table 144** ▪ AddPatchWholeFile Method Parameter

| Parameter      | Description                              |
|----------------|------------------------------------------|
| <b>FileKey</b> | Holds the file key of whole file object. |

## Applies To

- *ISWiLatestSetup*

## DeletePatchWholeFile Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the DeletePatchWholeFile method to remove ISWiPatchWholeFile object from the latest setup item.

### Syntax

DeletePatchWholeFile (PatchWholeFile As ISWiPatchWholeFile) As Long

### Parameter

**Table 145** ▪ DeletePatchWholeFile Method Parameter

| Parameter      | Description                                |
|----------------|--------------------------------------------|
| PatchWholeFile | Holds the whole file object to be deleted. |

### Applies To

- ISWiLatestSetup

## ISWiPatchWholeFiles Collection

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Contains collection of whole file objects belonging to the latest setup

## Members

|--------------|--------------------|-------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiPatchWholeFiles collection. |
| <b>Item</b>  | Read-Only Property | Provide the index number or FileKey in order to retrieve the ISWiPatchWholeFile object.         |

## Applies To

- [ISWiProject](#)

## ISWiPathVariables Collection

**Project** ■ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

The ISWiPathVariables collection contains all of the path variables that are associated with the current project. You can add a path variable with the [AddPathVariable method](#) and delete a path variable with the [DeletePathVariable method](#).

The following VBScript code retrieves a list of every path variable in the project and displays the path variables in a message box:

```
Option Explicit
Dim pProject
Set pProject = CreateObject ("ISWiAutoAutomation Interface Version.ISWiProject")

pProject.OpenProject "C:\MySetups\ISWiPathVariables.ism", True

Dim sPathVars
Dim pPathVar

For Each pPathVar In pProject.ISWiPathVariables
    sPathVars = sPathVars & pPathVar.Name & ": " & pPathVar.Value & vbNewLine
Next

WScript.Echo sPathVars
pProject.CloseProject
```

The following line illustrates how to access a particular path variable:

```
Set pPathVar = pProject.ISWiPathVariables.Item("MyPathVar")
```

**Important** ▪ Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see [Predefined Path Variables](#).

Members

| Name  | Type               | Description                                                                                                    |
|-------|--------------------|----------------------------------------------------------------------------------------------------------------|
| Count | Read-Only Property | Use this property to return the total number of path variables in the ISWiPathVariables collection.            |
| Item  | Read-Only Property | Provide the index number or name of the path variable to retrieve the <a href="#">ISWiPathVariable</a> object. |

Applies To

- [ISWiProject](#)

ISWiPreviousSetups Collection

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Contains collection of all previous setups belonging to the latest setup

Each patch configuration must contain at least one latest setup and one previous setup in order for you to create a patch. You can have multiple previous setups per latest setup.

Every application or setup that you intend to patch to a latest setup must be added to the previous setup node.

For example, your company supports versions 1.0 and 1.1 of an application, and you want to upgrade both of these applications to version 2.0. To create a single patch to upgrade both versions, you would add V1.0 and V1.1 as previous setups to the latest setup. Your latest setup would contain V2.0.

## AddPatchExternalFile Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddPatchExternalFile method to add a ISWiPatchExternalFile object to the latest setup item.

## Syntax

AddPatchExternalFile (Name As String) As ISWiPatchExternalFile

## Parameter

**Table 149** ▪ AddPatchExternalFile Method Parameter

| Parameter   | Description                      |
|-------------|----------------------------------|
| <b>Name</b> | Holds the name of external file. |

## Applies To

- ISWiLatestSetup

## DeletePatchExternalFile Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the DeletePatchExternalFile method to remove ISWiPatchExternalFile object from the latest setup item.

### Syntax

DeletePatchExternalFile (PatchExternalFile As ISWiPatchExternalFile) As Long

### Parameter

**Table 150** ▪ DeletePatchExternalFile Method Parameter

| Parameter         | Description                                   |
|-------------------|-----------------------------------------------|
| PatchExternalFile | Holds the external file object to be deleted. |

### Applies To

- ISWiLatestSetup

## ISWiProductConfigs Collection

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

InstallScript and InstallScript Object projects contain only one element in ISWiProductConfigs; it is named Media.

The ISWiProductConfigs collection contains all of the product configurations in the current project.

## Members

**Table 151** ▪ ISWiProductConfigs Collection Members

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiProductConfigs collection.                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the product configuration in order to retrieve the <b>ISWiProductConfig</b> object.</p> <p>The name of the product configurations is case-sensitive—"Product One" and "Product one" are two different configurations.</p> <p>Item is the default property for ISWiProductConfigs, which means that <code>pProject.ISWiProductConfigs.Item("Version 1")</code> is equivalent to <code>pProject.ISWiProductConfigs("Version 1")</code>.</p> |

## Example

The VBScript example below simply displays a string with each product configuration in the project:

```
Dim pProject
Set pProject = CreateObject ("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\Vegetarian.ism", True

Dim sNames
sNames = "This project contains the following product configurations: " & vbNewLine & vbTab

Dim pProductConfigs
For Each pProductConfigs In pProject.ISWiProductConfigs
    sNames = sNames & pProductConfigs.Name & vbNewLine & vbTab
Next

pProject.CloseProject

WScript.Echo sNames
```

The following line illustrates how to access a particular product configuration:

```
Set pProdConfig = pISWiProj.ISWiProductConfigs.Item("Version 1.1")
```

## Applies To

- **ISWiProject**

## ISWiProperties Collection

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISWiProperties collection contains all of the Windows Installer properties in the current project. This interface is similar to the Property Manager. You can add a property with the [AddProperty method](#) and delete a property with the [DeleteProperty method](#).

The VBScript code below retrieves a list of every property in the project and displays them in a message box:

Option Explicit

Dim pProject

Set pProject = CreateObject ("ISWiAutoAutomation Interface Version.ISWiProject")

pProject.OpenProject "C:\MySetups\ISWiProperties.ism", True

Dim sProps

Dim pProp

For Each pProp In pProject.ISWiProperties

sProps = sProps & pProp.Name & ": " & pProp.Value & " // " & \_  
pProp.Comments & vbNewLine

Next

WScript.Echo sProps

pProject.CloseProject

## ISWiReleases Collection

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*

The ISWiReleases collection contains all of the releases belonging to the current product configuration.

The following line illustrates how to access a particular [ISWiRelease](#) object:

```
Set pRelease = pProject.ISWiProductConfigs("Version 1").ISWiReleases("NewRelease1")
' In an InstallScript project, there is only one element
' in ISWiProductConfigs, which is named "Media".
```

## ISWiSequence Collection

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

The ISWiSequence collection is a virtual collection that contains all of the actions of the current project, sorted by sequence number.

## Members

**Table 155** ■ ISWiSequence Collection Members

| Name                        | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b>                | Read-Only Property | Use this property to return the total number of elements in the ISWiSequence collection.                                                                                                                                                                                                                                                                                                                                                     |
| <b>InsertCustomAction</b>   | Method             | Use this method to insert a custom action into the selected sequence. This method returns an <b>ISWiSequenceRecord</b> object.                                                                                                                                                                                                                                                                                                               |
| <b>Item</b>                 | Read-Only Property | <p>Provide the index number or name of an action in order to retrieve its <b>ISWiSequenceRecord</b> object.</p> <p>The name of the action is case-sensitive. That is, "ThisAction" and "thisAction" are two different actions.</p> <p>Item is the default property for ISWiSequence, which means that <code>pProject.InstallUISequence.Item("ThisAction")</code> is equivalent to <code>pProject.InstallUISequence("ThisAction")</code>.</p> |
| <b>RemoveSequenceRecord</b> | Method             | Use this method to remove an item from a sequence in the project.                                                                                                                                                                                                                                                                                                                                                                            |

## Example

The VBScript example below displays a string with each action name and sequence number in the project's Installation User Interface sequence:

```
Dim pProject
Set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\YourProject.ism", True ' open read-only

Dim sNames
sNames = "The Installation UI sequence contains the following actions:" & vbNewLine & vbTab

For i = 1 to pProject.InstallUISequence.Count
    sNames = sNames & pProject.InstallUISequence.Item(i).Name & " " & _
        pProject.InstallExecuteSequence.Item(i).Sequence & vbNewLine & vbTab
Next

pProject.CloseProject

MsgBox sNames
```

## Applies To

- **ISWiProject**

## InsertCustomAction Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the InsertCustomAction method to insert a custom action into one of the project's sequences.

### Syntax

```
InsertCustomAction (CustomAction As ISWiCustomAction, Comment As String, Condition as String,
SequenceNumber as Long) as ISWiSequenceRecord
```

### Parameters

**Table 156** ▪ InsertCustomAction Method Parameters

| Parameter             | Description                                          |
|-----------------------|------------------------------------------------------|
| <b>CustomAction</b>   | The custom action you want to create.                |
| <b>Comment</b>        | An optional string comment about your custom action. |
| <b>Condition</b>      | An optional string condition for your custom action. |
| <b>SequenceNumber</b> | The numeric sequence number for your custom action.  |

### Return Values

The InsertCustomAction method returns an [ISWiSequenceRecord](#) object.

### Applies To

- [ISWiSequence](#)

## RemoveSequenceRecord Method

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the RemoveSequenceRecord method to remove an item from a sequence in the current project.

### Syntax

```
(sName As String) As Long
```

## Parameters

**Table 157** ▪ RemoveSequenceRecord Method Parameters

| Parameter    | Description                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------|
| <b>sName</b> | Pass an ISWiSequenceRecord object to specify a sequence record that you want to remove from the project. |

## Return Values

**Table 158** ▪ RemoveSequenceRecord Method Values

| Return Value | Description                                        |
|--------------|----------------------------------------------------|
| <b>0</b>     | The item was successfully removed from a sequence. |
| <b>1</b>     | The item was not removed from a sequence.          |

## Applies To

- ISWiSequence

## ISWiSetupFiles Collection

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

ISWiSetupFiles is a collection that contains every support file (as an [ISWiSetupFile](#) object) in your project.

## Members

**Table 159** ■ ISWiSetupFiles Collection Members

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of support files in the ISWiSetupFiles collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the support file to retrieve the <b>ISWiSetupFile</b> object. For example, the following statements create references to the first support file in the collection and the support file named MySupportFile.bmp:</p> <pre>Set pSetupFile1 = pProj.ISWiSetupFiles.Item(1) Set pSetupFile2 = pProj.ISWiSetupFiles.Item("MySupportFile.bmp")</pre> <p>Item is the default property for ISWiSetupFiles, which means that pProj.ISWiSetupFiles.Item("MySupportFile.bmp") is equivalent to pProj.ISWiSetupFiles("MySupportFile.bmp").</p> |

## Example

The following Visual Basic code illustrates how you would set a property for a specific support file:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiSetupFiles(1).Splash = True

pProj.SaveProject
pProj.CloseProject
```

## Applies To

- **ISWiProject**

## ISWiSetupTypes Collection

**Project** ■ This information applies to the following project types:

- *InstallScript*
- *InstallScript MSI*

ISWiSetupTypes is a collection that contains every setup type (as an **ISWiSetupType** object) in your project.

Table 160 ▪ ISWiSetupTypes Collection Members

| Name  | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Count | Read-Only Property | Use this property to return the total number of setup types in the ISWiSetupTypes collection.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Item  | Read-Only Property | <p>Provide the index number or name of the setup type to retrieve the <b>ISWiSetupType</b> object. For example, the following statements create references to the first setup type in the collection and the setup type named CSSaveSpace:</p> <pre>Set pSetupFile1 = pProj.ISWiSetupTypes.Item(1) Set pSetupFile2 = pProj.ISWiSetupTypes.Item("CSSaveSpace")</pre> <p>Item is the default property for ISWiSetupTypes, which means that pProj.ISWiSetupTypes.Item("CSSaveSpace") is equivalent to pProj.ISWiSetupTypes("CSSaveSpace").</p> |

Example

The following Visual Basic code illustrates how you would set a property for a specific setup type:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiSetupTypes("CSSaveSpace").DisplayName = "Client Setup - Save Space"

pProj.SaveProject
pProj.CloseProject
```

Applies To

- **ISWiProject**

ISWiShellProperties Collection

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiShellProperties is a collection of all of the Shell properties for a specified **ISWiShortcut** object.

## Members

**Table 161** ▪ ISWiShellProperties Collection Members

| Name         | Type               | Description                                                                                                               |
|--------------|--------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiShellProperties collection.                           |
| <b>Item</b>  | Read-Only Property | Provide the index number or name of the Shell property in order to retrieve the <a href="#">ISWiShellProperty</a> object. |

## Example

The following sample VBScript snippet retrieves the ISWiShellProperty object for the primary key MyShellProperty from the ISWiShellProperties collection:

```
Dim pShellProperty As ISWiShellProperty
Set pShellProperty = pShortcut.ISWiShellProperties("MyShellProperty")
```

## Applies To

- [ISWiShortcut](#)

## ISWiShortcuts Collection

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

ISWiShortcuts contains every shortcut belonging to a specified [ISWiFolder](#) object.

The following example makes a copy of the shortcut named MyShortcut under the program folder contained in m\_pFolder:

```
Dim m_pShortcut As ISWiShortcut
Set m_pShortcut = m_pFolder.ISWiShortcuts("MyShortcut")
```

## Members

|--------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiShortcuts collection.                                                                                                                                                                                                                                  |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the shortcut in order to retrieve the <a href="#">ISWiShortcut</a> object.</p> <p>Item is the default property for ISWiShortcuts, which means that <code>m_pFolder.ISWiShortcuts.Item("MyShortcut")</code> is equivalent to <code>m_pFolder.ISWiShortcuts("MyShortcut")</code>.</p> |

## Applies To

- [ISWiFolder](#)

## ISWiSISProperties Collection

**Project** ■ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

This collection contains all of the values for the Summary Information Stream settings in the current project. By accessing an element in this collection, you can set all of the Summary Information Stream settings in the General Information view.

The following Visual Basic code reads every Summary Information Stream setting in your project and displays each setting and its value.

```
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.ism", True

Dim sSISProps As String
sSISProps = "This package's Summary Information Stream has the following " & _
    pProject.ISWiSISProperties.Count & " properties:"

Dim pSISProp As ISWiSISProperty
For Each pSISProp In pProject.ISWiSISProperties
    sSISProps = sSISProps & vbNewLine & vbTab & _
        pSISProp.Name & ": " & pSISProp.Value
Next
```

MsgBox sSISProps

pProject.CloseProject

## Members

**Table 163** ■ ISWiSISProperties Collection Members

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiSISProperties collection. Since the Summary Information Stream contains seven items at present, Count always has a value of 7.                                                                                                                                                                                                                             |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or name of the property in order to retrieve the <b>ISWiSISProperty</b> object.</p> <p>The name of the property is case-sensitive—"TemplateSummary" and "Templatesummary" are two different properties.</p> <p>Item is the default property for ISWiSISProperties, which means that pISWiProject.ISWiSISProperties.Item("Subject") is equivalent to pISWiProject.ISWiSISProperties("Subject").</p> |

## Applies To

- **ISWiProject**

## ISWiSQLConnections Collection

**Project** ■ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

The ISWiSQLConnections collection contains all of the SQL Server connections in the current project.

Members

ISWiSQLDatabaseServers Collection

**Project** • This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

The ISWiSQLDatabaseServers collection contains all the database servers that you can choose to target by version requirements at run time.

## Members

**Table 165** ▪ ISWiSQLDatabaseServers Collection Members

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## ISWiSQLScriptErrors Collection

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

The ISWiSQLScriptErrors collection contains all of the custom SQL script error handling entries for the ISWiSQLScriptError object.

## Members

**Table 168** ▪ ISWiSQLScriptErrors Collection Members

| Name         | Type               | Description                                                                                                          |

## ISWiUpgradeTableEntries Collection

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The ISWiUpgradeTableEntries collection contains all the static major upgrade items, as they are defined in the Upgrades view as well as the Upgrade table in the Direct Editor.

## Members

**Table 171** ■ ISWiUpgradeTableEntries Collection Members

| Name         | Type               | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of elements in the ISWiUpgradeTableEntries collection.                                                                                                                                                                                                                                                                                                    |
| <b>Item</b>  | Read-Only Property | <p>Provide the index number or upgrade code in order to retrieve the ISWiUpgradeTableEntries items.</p> <p>Item is the default property for ISWiUpgradeTableEntries, which means that <code>m_ISWiProject.ISWiUpgradeTableEntries.Item("12345678-1234-1234-1234-123456789012")</code> is equivalent to <code>m_ISWiProject.ISWiUpgradeTableEntries("12345678-1234-1234-1234-123456789012")</code>.</p> |

## Example

```
Dim oProj As ISWiProject
Dim oUpgradeItem As ISWiUpgradeTableEntry

Set oProj = New ISWiProject
oProj.OpenProject "C:\MySetup.ism"

For Each oUpgradeItem In oProj.ISWiUpgradeTableEntries
    oUpgradeItem.Language = "1033"
Next

oProj.SaveProject
oProj.CloseProject
```

To target a specific item, replace the For Each loop in the above code with this code:

```
For Each oUpgradeItem In oProj.ISWiUpgradeTableEntries
    If oUpgradeItem.UpgradeCode = "{12345678-1234-1234-1234-123456789012}" Then
        oUpgradeItem.Language = "1033"
    End If
Next
```

# Automation Objects for Advanced UI and Suite/Advanced UI Projects

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

Each InstallShield automation object represents an installation element such as a feature, a component, or a file. This section describes each of the InstallShield automation objects.

The highest-level object in the automation interface is the [ISWiProject object](#). The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.

## ISWiProject Object (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

ISWiProject contains the interface for opening, closing, and saving an Advanced UI or Suite/Advanced UI project (.issuite) file. When InstallShield is installed on your system, you can instantiate a copy of ISWiProject with the following VB and VBScript syntax:

```
Set m_ISWiProject = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
```

To open an installation project, call the OpenProject method, as follows:

```
' Build path to the .ism file
strFile = "C:\InstallShield 2021 Projects\Test.issuite"
m_ISWiProject.OpenProject strFile
```

**Important** • If you are using the automation interface on a 64-bit machine, you may need to load the automation interface through a 32-bit executable file. Otherwise, you may encounter an error when you instantiate a copy of ISWiProject, or any other object. For more information, see [Using the Automation Interface on a 64-Bit System](#).

## Members

The following members of the ISWiProject object are available in the automation interface. Note that some methods, properties, and collections are available only for a particular project type.

**Table 1** • ISWiProject Object Members

| Name                    | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ActiveLanguage</b>   | Read-Write String Property | Gets or sets the default language of the project. Specify a single language as a language identifier; for example:<br><br>project.ActiveLanguage = "1033";                                                                                                                                                                                                                                             |
| <b>AddExitCondition</b> | Method                     | Adds an exit error message that you want the Advanced UI or Suite/Advanced UI installation to display under various conditions before ending the installation.                                                                                                                                                                                                                                         |
| <b>AddLanguage</b>      | Method                     | <br><b>Project</b> ▪ This is available in Suite/Advanced UI projects.<br><br><br><b>Edition</b> ▪ The Suite/Advanced UI project type is available in the Premier edition of InstallShield.<br><br>Adds a language to the project.    |
| <b>AddPathVariable</b>  | Method                     | Adds a path variable to the project.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>AddProperty</b>      | Method                     | Adds an Advanced UI or Suite/Advanced UI property with a specified name to the project                                                                                                                                                                                                                                                                                                                 |
| <b>AddSetupFile</b>     | Method                     | Adds a support file with the specified name to the project.                                                                                                                                                                                                                                                                                                                                            |
| <b>AddSuiteAction</b>   | Method                     | <br><b>Project</b> ▪ This is available in Suite/Advanced UI projects.<br><br><br><b>Edition</b> ▪ The Suite/Advanced UI project type is available in the Premier edition of InstallShield.<br><br>Adds an action to the project. |
| <b>AddSuiteFeature</b>  | Method                     | Adds a feature to the project or as a subfeature of an existing feature.                                                                                                                                                                                                                                                                                                                               |
| <b>AddSuitePackage</b>  | Method                     | Adds a package to the project along with the specified target file and options for adding additional files.                                                                                                                                                                                                                                                                                            |
| <b>AddSuiteRelease</b>  | Method                     | Adds a release to the project.                                                                                                                                                                                                                                                                                                                                                                         |

**Table 1** • ISWiProject Object Members (cont.)

| Name                          | Type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddSuiteTransaction</b>    | Method                      | <p>Adds a Windows Installer transaction to the project.</p> <p>Once your project contains a transaction, you can add .msi and .msp packages to the transaction.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>ArpComments</b>            | Read-Write String Property  | Gets or sets comments about your product. This information is displayed for your product's entry in Programs and Features.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ArpDisableChange</b>       | Read-Write Boolean Property | <p>Gets or sets the value of the Disable Change Button setting in the General Information view. This setting is where you specify whether you want to disable the Change button for your product's entry in Programs and Features. The Change button enables end users to change installation options after the product has been installed. End users can remove or add features as needed.</p>                                                                                                                                                                                                                                                                                                                                |
| <b>ArpDisableRegistration</b> | Read-Write Boolean Property | <p>Inhibits or allows registration of the product in Programs and Features. If registration is disabled, the other Arp properties are ignored. Available values are:</p> <ul style="list-style-type: none"> <li>● <b>False</b>—Your Advanced UI or Suite/Advanced UI product's entry is displayed on the target system in Programs and Features. This is the default value.</li> <li>● <b>True</b>—Your Advanced UI or Suite/Advanced UI product's entry is not displayed on the target system in Programs and Features. The end user cannot use Programs and Features to remove the product, perform maintenance, or view support information. If you select this option, the other Arp properties are irrelevant.</li> </ul> |
| <b>ArpDisableRemove</b>       | Read-Write Boolean Property | <p>Gets or sets the value of the Disable Remove Button setting in the General Information view. This setting is where you specify whether you want to disable the Remove button for your product's entry in Programs and Features. The Remove button enables end users to remove the product by clicking one button, which runs your uninstaller with a reduced user interface.</p> <p>If the end user clicks the Remove button to remove your product, actions in the User Interface sequence of the project are executed.</p>                                                                                                                                                                                                |

**Table 1** • ISWiProject Object Members (cont.)

| Name                   | Type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>ArpHelpContact</b>  | Read-Write String Property  | <p>Gets or sets the name of the person or department that end users should contact for technical support.</p> <p>On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Programs and Features.</p>                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ArpHelpTelPhone</b> | Read-Write String Property  | <p>Gets or sets the technical support phone number for your product.</p> <p>On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Programs and Features.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ArpHelpUrl</b>      | Read-Write String Property  | <p>Gets or sets the URL that you would like end users to visit for technical support information for your product. This URL is displayed for your product's entry in Programs and Features.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ArpIcon</b>         | Read-Write String Property  | <p>Gets or sets the path on your development system to the .ico, .exe or .dll file that contains the icon resource that you want to be used for your product's entry in Programs and Features.</p> <p>If you want to use the icon in a file that is present on target systems (for example, in a file that is installed by one of the packages in the Advanced UI or Suite/Advanced UI installation), you can use a directory property as part of the path for the icon file. If you leave this property empty, InstallShield uses the icon that is specified in the Setup.exe Icon File setting on the Setup.exe tab in the Releases view.</p> |
| <b>ArpIconIndex</b>    | Read-Write Integer Property | <p>If the icon file that you specify contains more than one icon resource, you can use the ArpIconIndex property to specify the index.</p> <ul style="list-style-type: none"> <li>• A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 refers to the first icon in the file, 1 refers to the second icon, and 2 refers to the third icon.</li> <li>• Use a negative number to refer to a specific resource ID. For example, the icon index -12 refers to the icon with a resource ID of 12.</li> </ul>                                                                                      |

**Table 1** • ISWiProject Object Members (cont.)

| Name                       | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ArpProductUrl</b>       | Read-Write String Property | <p>Gets or sets a general URL for your company or product—for example, <a href="http://www.mycompany.com">http://www.mycompany.com</a>.</p> <p>On some versions of Windows, the publisher name on the Support Info dialog box is a hyperlink to this URL. The Support Info dialog box is displayed when an end user clicks the support information hyperlink for your product's entry in Programs and Features.</p>                     |
| <b>ArpPublisher</b>        | Read-Write String Property | <p>Gets or sets the name of the company that created the product. This information is displayed for your product's entry in Programs and Features.</p>                                                                                                                                                                                                                                                                                  |
| <b>ArpReadMe</b>           | Read-Write String Property | <p>Gets or sets a valid URL for a Readme file or Customer Support page for your product.</p> <p>On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Programs and Features.</p>                                                                                                                                                                                        |
| <b>ArpUpdateUrl</b>        | Read-Write String Property | <p>Gets or sets a URL where end users can get information about product updates or download the latest version.</p> <p>On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Programs and Features.</p>                                                                                                                                                                 |
| <b>CloseProject</b>        | Method                     | Closes an Advanced UI or Suite/Advanced UI project.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>CreateProject</b>       | Method                     | Creates a new InstallShield project file (.issuite) for an Advanced UI or Suite/Advanced UI project.                                                                                                                                                                                                                                                                                                                                    |
| <b>DeleteExitCondition</b> | Method                     | Removes an exit error message from the project.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>DeleteLanguage</b>      | Method                     | <div>  <p><b>Project</b> • This is available in Suite/Advanced UI projects.</p> </div> <div>  <p><b>Edition</b> • The Suite/Advanced UI project type is available in the Premier edition of InstallShield.</p> </div> <p>Removes a language from the project.</p> |
| <b>DeletePathVariable</b>  | Method                     | Removes a path variable from the project.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DeleteProperty</b>      | Method                     | Removes an Advanced UI or Suite/Advanced UI property from the project.                                                                                                                                                                                                                                                                                                                                                                  |

**Table 1** ▪ ISWiProject Object Members (cont.)

| Name                      | Type       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DeleteSetupFile</b>    | Method     | Removes a support file from the project.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DeleteSuiteAction</b>  | Method     |  <p><b>Project</b> ▪ This is available in Suite/Advanced UI projects.</p>  <p><b>Edition</b> ▪ The Suite/Advanced UI project type is available in the Premier edition of InstallShield.</p> <p>Removes an action from the project.</p>                                               |
| <b>DeleteSuiteFeature</b> | Method     | Removes a feature from the project.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>DeleteSuitePackage</b> | Method     | Removes a package or a Windows Installer transaction from the project.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>DeleteSuiteRelease</b> | Method     | Removes a release from the project.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ForceUpgrade</b>       | Method     | Upgrades the project from an earlier version of InstallShield to the current version.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>GenerateGUID</b>       | Method     | Generates a new, unique GUID that is returned as a string.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>OpenProject</b>        | Method     | Opens an Advanced UI or Suite/Advanced UI project so that you can modify it through the automation interface                                                                                                                                                                                                                                                                                                                                           |
| <b>ISWiLanguages</b>      | Collection | Contains all of the languages in the current project.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ISWiPathVariables</b>  | Collection | Contains all of the Advanced UI or Suite/Advanced UI path variables in the current project.                                                                                                                                                                                                                                                                                                                                                            |
| <b>ISWiProperties</b>     | Collection | Contains all of the Advanced UI or Suite/Advanced UI properties in the current project.                                                                                                                                                                                                                                                                                                                                                                |
| <b>ISWiSetupFiles</b>     | Collection | Contains all of the support files in the current project.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>ISWiSuiteActions</b>   | Collection |  <p><b>Project</b> ▪ This is available in Suite/Advanced UI projects.</p>  <p><b>Edition</b> ▪ The Suite/Advanced UI project type is available in the Premier edition of InstallShield.</p> <p>Contains all of the Suite/Advanced UI actions that are included in a project.</p> |

| Name                           | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ISWiSuiteEvent</b>          | Method                     |  <p><b>Project</b> ■ This is available in Suite/Advanced UI projects.</p>  <p><b>Edition</b> ■ The Suite/Advanced UI project type is available in the Premier edition of InstallShield.</p> <p>Accesses a specific event in the project.</p>                                                               |
| <b>ISWiSuiteEvents</b>         | Collection                 |  <p><b>Project</b> ■ This is available in Suite/Advanced UI projects.</p>  <p><b>Edition</b> ■ The Suite/Advanced UI project type is available in the Premier edition of InstallShield.</p> <p>Contains all of the events that are in a project.</p>                                                       |
| <b>ISWiSuiteFeatures</b>       | Collection                 | <p>Contains every feature (as an ISWiSuiteFeature object) in your project.</p> <p>When ISWiSuiteFeatures is a member of ISWiProject, it contains all of the root-level features in the project. To retrieve a collection of subfeatures, access the Features property of the ISWiSuiteFeature object. The result is an ISWiSuiteFeatures collection that contains the immediate subfeatures of the current root-level feature. Repeat for further levels of subfeatures.</p> |
| <b>ISWiSuiteExitConditions</b> | Collection                 | Contains all of the exit conditions in your project.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ISWiSuitePackages</b>       | Collection                 | Contains every package (as an ISWiSuitePackage object) and every Windows Installer transaction (also as an ISWiSuitePackage object) in your project.                                                                                                                                                                                                                                                                                                                         |
| <b>ISWiSuiteReleases</b>       | Collection                 | Contains all of the releases in your Advanced UI or Suite/Advanced UI project.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ProductName</b>             | Read-Write String Property | Gets or sets the name of the product. For information on how the product name is used, see <a href="#">Specifying a Product Name</a> .                                                                                                                                                                                                                                                                                                                                       |
| <b>ProjectType</b>             | Read-only Integer Property | <p>Gets the project type. The valid value is:</p> <ul style="list-style-type: none"> <li>● <b>eptSuite (16)</b>—Advanced UI or Suite/Advanced UI project</li> </ul>                                                                                                                                                                                                                                                                                                          |

**Table 1** • ISWiProject Object Members (cont.)

| Name                  | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ProductVersion</b> | Read-Write String Property | <p>Gets or sets the version number for your product. The version must contain only numbers. It is typically in the format <i>aaa.bbb.ccccc</i> or <i>aaa.bbb.ccccc.ddddd</i>, where <i>aaa</i> represents the major version number, <i>bbb</i> represents the minor version number, <i>cccc</i> represents the build number, and <i>dddd</i> represents the revision number. The maximum value for the <i>aaa</i> and <i>bbb</i> portions is 255. The maximum value for <i>cccc</i> and <i>dddd</i> is 65,535.</p> <p>Note that although you can include the fourth field (<i>dddd</i>), the installation does not use this part of the product version to distinguish between different product versions. To learn more, see <a href="#">Specifying the Product Version</a>.</p> |
| <b>SaveProject</b>    | Method                     | Saves the Advanced UI or Suite/Advanced UI project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>SuiteGuid</b>      | Read-Write String Property | <p>Gets or sets a GUID that uniquely identifies the Advanced UI or Suite/Advanced UI installation. To have generate a different GUID, call <a href="#">GenerateGUID</a>.</p> <p>Since this code uniquely identifies your Advanced UI or Suite/Advanced UI installation, changing the Suite GUID after you have already distributed your release is not recommended.</p>                                                                                                                                                                                                                                                                                                                                                                                                           |

## AddExitCondition Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddExitCondition method adds an exit condition to the project. Using this method is similar to defining an exit condition in the General Information view in InstallShield. You can set the properties of the exit condition with the ISWiSuiteExitCondition object.

### Syntax

AddExitCondition (Message As String)

## Parameters

**Table 2** • AddExitCondition Method Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Message</b> | Specify the error message that you want the Advanced UI or Suite/Advanced UI installation to display at run time if the condition that you are configuring is true.<br><br>As an alternative, you can enter a string identifier whose value is the error message that you want the installation to use. |

## Applies To

- ISWiProject

## AddLanguage Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to Suite/Advanced UI projects.

**Edition** • Support for multilanguage installations is available with InstallShield Premier Edition.

The AddLanguage method adds a language to the project. Using this method is similar to adding a language in the General Information view in InstallShield. You can set the properties of the new language with the ISWiLanguage object.

## Syntax

AddLanguage (LangId As String)

## Parameters

**Table 3** • AddLanguage Method Parameters

| Parameter     | Description                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>LangId</b> | Specify the language ID (as a string) that you want to add to the current project.<br>For example:<br><br>oProject.AddLanguage "1035" |

## Applies To

- ISWiProject

# AddPathVariable Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddPathVariable method adds a path variable to the project. Using this method is similar to adding a path variable in the Path Variables view in InstallShield. You can set the properties of the new path variable with the ISWiPathVariable object.

**Important** ▪ Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see [Predefined Path Variables](#).

## Syntax

AddPathVariable (sName As String) As ISWiPathVariable

## Parameters

**Table 4** ▪ AddPathVariable Method Parameters

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| sName     | Specify the name of the path variable that you want to add. |

## Applies To

- ISWiProject

# AddProperty Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddProperty method adds an Advanced UI or Suite/Advanced UI property with a specified name to the project.

## Syntax

AddProperty (Name As String) As ISWiProperty

## Parameters

**Table 5** • AddProperty Method Parameters

| Parameter   | Description                                                                             |
|-------------|-----------------------------------------------------------------------------------------|
| <b>Name</b> | Specify the name of the Advanced UI or Suite/Advanced UI property that you want to add. |

## Example

The following Visual Basic lines demonstrate this method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.issuite"

Dim pProperty As ISWiProperty
Set pProperty = pProj.AddProperty ("MYPROP")
pProperty.Value = "MyPropValue"

pProj.SaveProject
pProj.CloseProject
```

## Applies To

- [ISWiProject](#)

## AddSetupFile Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- [Advanced UI](#)
- [Suite/Advanced UI](#)

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddSetupFile method adds a support file with the specified name to the project. Using this method is similar to adding a path variable in the Support Files view in InstallShield. You can set the properties of the new path variable with the ISWiSetupFile object.

## Syntax

AddSetupFile (FileName As String) As ISWiSetupFile

## Parameters

**Table 6** - AddSetupFile Method Parameters

| Parameter | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| FileName  | Specify the fully qualified path and file name of the support file that you want to add. |

## Example

The following Visual Basic lines demonstrate this method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.issuite"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.AddSetupFile ("C:\My Files\MySupportFile.ext")

pProj.SaveProject
pProj.CloseProject
```

## Applies To

- ISWiProject

## AddSuiteAction Method (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the Suite/Advanced UI projects.

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddSuiteAction method adds an action to the project.

## Syntax

AddSuiteAction (ActionName As String, ActionType As ISWiSuiteActionType) as ISWiSuiteAction

## Parameters

**Table 7** • AddSuiteAction Method Parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ActionName</b> | Specify the name of the action that you want to add.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ActionType</b> | <p>Specify the type of action. Available options are:</p> <ul style="list-style-type: none"><li>● <b>esatDll (1)</b>—Calls a function in a DLL file.</li><li>● <b>esatPowerShell (2)</b>—Runs a PowerShell script to perform system configuration tasks.</li><li>● <b>esatExe (4)</b>—Launches an executable file. The Suite/Advanced UI engine waits for the action to complete before proceeding with the next part of the installation.</li><li>● <b>esatStartExe (8)</b>—Launches an executable file. The Suite/Advanced UI engine runs the action simultaneously as the next part of the installation proceeds.</li><li>● <b>esatSetProperty (16)</b>—Sets a Suite/Advanced UI property.</li><li>● <b>esatIScript (32)</b>—Runs InstallScript code.</li><li>● <b>esatClr (64)</b>—Calls a public method in a managed assembly.</li><li>● <b>esatCoreClr (128)</b>—Calls a public method in a .NET Core managed assembly.</li></ul> |

## Applies To

- ISWiProject

## AddSuiteFeature Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddSuiteFeature method creates a feature with the specified name. AddSuiteFeature is a member of ISWiProject. The new feature is added to the current project as a root-level feature, but when this method is a member of an ISWiSuiteFeature object, the new feature is added as a subfeature of the current feature.

The feature is created with the same default properties that new features have when you add them in InstallShield.

After you have added the feature, you can set its other properties and associate packages with it.

## Syntax

AddSuiteFeature (SuiteFeatureKey As String) As ISWiSuiteFeature

## Parameters

**Table 8 •** AddSuiteFeature Method Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SuiteFeatureKey</b> | The feature key is the same as the name of the feature that is displayed in the Features view. The name becomes the index for the new ISWiSuiteFeature object. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. FeatureKey must be unique among your project's feature names.<br><br>Feature names are case-sensitive. |

## Example

The following Visual Basic lines demonstrate calling AddSuiteFeature to add a feature and a subfeature:

```
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.issuite"

Dim pFeat1, pFeat2 As ISWiSuiteFeature
Dim sFeat1Name, sFeat2Name As String

sFeat1Name = "ParentFeature"
sFeat2Name = "SubFeature"

' Add the feature ParentFeature, then SubFeature under ParentFeature
Set pFeat1 = pProject.AddSuiteFeature(sFeat1Name)
Set pFeat2 = pFeat1.AddSuiteSubFeature(sFeat2Name)

pProject.SaveProject
pProject.CloseProject
```

## Applies To

- ISWiProject

## AddSuitePackage Method (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Project-specific differences are noted where applicable.

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddSuitePackage method adds a package (such as an .msi package, an InstallScript package, an .exe package, or other supported type) along with the specified target file and options for adding additional files. Using this method is similar to adding a package in the Packages view in InstallShield. You can set the properties of the new package with the ISWiSuitePackage object.

### Syntax

```
AddSuitePackage (PackageType As ISWiSuitePackageType, TargetFileName As String, AdditionalFiles As  
ISWiAdditionalFiles) As ISWiSuitePackage
```

## Parameters

**Table 9** • AddSuitePackage Method Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PackageType</b>     | <p>Specify the type of package that you are adding to the project.</p> <p>The following project types are available in Advanced UI and Suite/Advanced UI projects:</p> <ul style="list-style-type: none"><li>• <b>esptMsi (1)</b>—Windows Installer package (.msi)</li><li>• <b>esptMsp (2)</b>—Windows Installer patch (.msp)</li><li>• <b>esptIsip (4)</b>—InstallScript package</li></ul> <p>The following project types are available only in Suite/Advanced UI projects:</p> <ul style="list-style-type: none"><li>• <b>esptTransaction (-1)</b>—Windows Installer transaction. This package type is available in Suite/Advanced UI projects.</li><li>• <b>esptExe (3)</b>—executable package (.exe). This package type is available in Suite/Advanced UI projects.</li><li>• <b>esptIsmMsi (5)</b>—Basic MSI project (.ism)</li><li>• <b>esptIsmIsip (6)</b>—InstallScript project (.ism)</li><li>• <b>esptAppx (7)</b>—Sideloaded Windows App package (.appx)</li><li>• <b>esptWebDeploy (8)</b>—Web Deploy package (.zip)</li><li>• <b>esptAppxBundle (9)</b>—Sideloaded Windows App package (.appxbundle)</li><li>• <b>esptWpm (10)</b>—Windows Package Manager package</li></ul> |
| <b>TargetFileName</b>  | <p>Specify the file in the package (such as the .msi file) that the Advanced UI or Suite/Advanced UI installation should invoke.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>AdditionalFiles</b> | <p>Specify the type of additional files that you want to add for the package. Available options are:</p> <ul style="list-style-type: none"><li>• <b>eaftNothing (0)</b>—Add nothing. This package does not need any additional files.</li><li>• <b>eaftAdjacentFiles (1)</b>—Add adjacent files; that is, add the files next to this package.</li><li>• <b>eaftSubFolders (2)</b>—Add files in subfolders; that is, add the files below this package.</li><li>• <b>eaftAdjacentFilesAndSubFolders (3)</b>—Add adjacent files and files in subfolders; that is, add the files next to and below this package.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Note** • If you are using this method to add a Windows Package Manager (WPM) package to a project, you do not specify the target file and additional files.

## Applies To

- ISWiProject

## AddSuiteRelease Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddSuiteRelease method adds a release with the specified name to the project. Using this method is similar to adding a release in the Releases view in InstallShield. You can set the properties of the new release with the ISWiSuiteRelease object.

## Syntax

AddSuiteRelease (ReleaseName As String) as ISWiSuiteRelease

## Parameters

**Table 10** ▪ AddSuiteRelease Method Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ReleaseName | Specify the name of the release that you want to add. |

## Applies To

- ISWiProject

## AddSuiteTransaction Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the Suite/Advanced UI projects.

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddSuiteTransaction method adds a Windows Installer transaction to a Suite/Advanced UI project, and it returns a package. Once your project contains a transaction, you can add .msi and .msp packages to the transaction.

## Syntax

AddSuiteTransaction () As ISWiSuitePackage

## Parameters

The AddSuiteTransaction method does not take any parameters.

## Applies To

- [ISWiProject](#)

## CloseProject Method (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the following project types:

- [Advanced UI](#)
- [Suite/Advanced UI](#)

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

To close the .issuite file that you opened with OpenProject, call CloseProject.

## Syntax

CloseProject ()

## Return Values

CloseProject always returns 0.

## Applies To

- [ISWiProject](#)

## CreateProject Method (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the following project types:

- [Advanced UI](#)
- [Suite/Advanced UI](#)

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The CreateProject method creates a new InstallShield project file (.issuite) for Advanced UI and Suite/Advanced UI projects.

## Syntax

CreateProject (strISWiProjectFile As String, ByVal ProjectType As ISWiProjectType)

## Parameters

**Table 11** - CreateProject Method Parameters

| Parameter                 | Description                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>strISWiProjectFile</b> | Enter the fully qualified path to the .issuite file that you want to create. Include the full file name.                                                                                             |
| <b>ProjectType</b>        | Specify the type of project that you want to create. The valid value is: <ul style="list-style-type: none"><li>• <b>eptSuite (16)</b>—Creates an Advanced UI or Suite/Advanced UI project.</li></ul> |

## Example

The following sample code creates an Advanced UI or Suite/Advanced UI project and sets its product version to 2.00.0000.

```
dim proj
set proj = CreateObject("ISWiAutoSuite22.ISWiProject")

proj.CreateProject "d:\scratch\packagetest.issuite", 16 '16: ISWiProjectType.eptSuite
proj.OpenProject "d:\scratch\packagetest.issuite", false

proj.ProductVersion = "2.00.0000"

proj.SaveProject
proj.CloseProject
```

## Applies To

- **ISWiProject**

## DeleteExitCondition Method (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the following project types:

- **Advanced UI**

- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteExitCondition method removes an exit condition from the project. Using this method is similar to removing an exit condition in the General Information view in InstallShield.

### Syntax

DeleteExitCondition (ExitCondition As ISWiSuiteExitCondition)

### Parameters

**Table 12** ▪ DeleteExitCondition Method Parameters

| Parameter            | Description                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------|
| <b>ExitCondition</b> | Specify the ISWiSuiteExitCondition object that you want the method to remove from your project. |

### Applies To

- ISWiProject

## DeleteLanguage Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the Suite/Advanced UI projects.

**Edition** ▪ Support for multilanguage installations is available with InstallShield Premier Edition.

The DeleteLanguage method removes a language from the current project. Using this method is similar to removing a language in the General Information view in InstallShield.

### Syntax

DeleteLanguage (Language As ISWiLanguage)

## Parameters

**Table 13** ▪ DeleteLanguage Method Parameters

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| Language  | Specify the ISWiLanguage object that you want the method to remove from your project. |

## Applies To

- ISWiProject

## DeletePathVariable Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeletePathVariable method removes a path variable with a specified name from the project.

**Important** ▪ Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see [Predefined Path Variables](#).

## Syntax

DeletePathVariable (pPathVar ISWiPathVariable) As Long

## Parameters

**Table 14** ▪ AddPathVariable Method Parameters

| Parameter | Description                                                                     |
|-----------|---------------------------------------------------------------------------------|
| pPathVar  | Pass the ISWiPathVariable object for the path variable that you want to delete. |

## Applies To

- ISWiProject

# DeleteProperty Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteProperty method removes an Advanced UI or Suite/Advanced UI property with a specified name from the project.

## Syntax

DeleteProperty(ByVal pProperty As ISWiProperty) As Long

## Parameters

**Table 15** ▪ DeleteProperty Method Parameters

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| Property  | Pass the ISWiProperty object that you want to remove. |

## Example

The following Visual Basic lines demonstrate this method:

```
Dim proj As ISWiAutoSuiteAutomation Interface Version.ISWiProject
Set proj = New ISWiAutoSuiteAutomation Interface Version.ISWiProject
proj.OpenProject "c:\mysetups\your project name-3.issuite"
Dim pProp As ISWiAutoSuiteAutomation Interface Version.ISWiProperty
Set pProp = proj.ISWiProperties.Item("MyProperty")
proj.DeleteProperty pProp
```

## Applies To

- ISWiProject

# DeleteSetupFile Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteSetupFile method removes the specified support file from the project.

## Syntax

DeleteSetupFile (pSetupFile As ISWiSetupFile) As Long

## Parameters

**Table 16** ▪ DeleteSetupFile Method Parameters

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| pSetupFile | Pass the ISWiSetupFile object that you want to delete. |

## Example

The following Visual Basic lines demonstrate this method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.issuite"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.ISWiSetupFiles.Item("MySupportFile.abc")
pProj.DeleteSetupFile pSetupFile

pProj.SaveProject
pProj.CloseProject
```

## Applies To

- [ISWiProject](#)

## DeleteSuiteAction Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the Suite/Advanced UI projects.

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteSuiteAction method removes an action from the project.

## Syntax

DeleteAction (SuiteAction As ISWiSuiteAction)

## Parameters

**Table 17** ▪ AddSuiteAction Method Parameters

| Parameter   | Description                                                 |
|-------------|-------------------------------------------------------------|
| SuiteAction | Specify the ISWiSuiteAction object that you want to delete. |

## Applies To

- ISWiProject

## DeleteSuiteFeature Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteSuiteFeature method permanently removes a feature from the current project.

## Syntax

DeleteSuiteFeature (Feature As ISWiSuiteFeature) As Long

## Parameters

**Table 18** ▪ DeleteSuiteFeature Method Parameters

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| Feature   | Specify the ISWiSuiteFeature object that you want to remove. |

## Applies To

- ISWiProject

# DeleteSuitePackage Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteSuitePackage method removes a package or a Windows Installer transaction from the current project.

## Syntax

DeleteSuitePackage (Package As ISWiSuitePackage) As Long

## Parameters

**Table 19** ▪ DeleteSuitePackage Method Parameters

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| Package   | Specify the ISWiSuitePackage object that you want to remove. |

## Applies To

- ISWiProject

# DeleteSuiteRelease Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteSuiteRelease method removes a release from the Advanced UI or Suite/Advanced UI project.

## Syntax

DeleteSuiteRelease (SuiteRelease As ISWiSuiteRelease)

## Parameters

**Table 20** ▪ DeleteSuiteRelease Method Parameters

| Parameter           | Description                                               |
|---------------------|-----------------------------------------------------------|
| <b>SuiteRelease</b> | Pass the ISWiSuiteRelease object that you want to delete. |

## Applies To

- [ISWiProject](#)

## ForceUpgrade Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ForceUpgrade method upgrades the project from an earlier version of InstallShield to the current version.

## Syntax

ForceUpgrade (ISWiProjectFile As String)

## Parameters

**Table 21** ▪ ForceUpgrade Method Parameters

| Parameter              | Description                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ISWiProjectFile</b> | Enter the fully qualified path to the Advanced UI or Suite/Advanced UI project file (.issuite) that you want to upgrade. Include the full file name. |

## Applies To

- [ISWiProject](#)

## GenerateGUID Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The GenerateGUID method generates a new, unique GUID that is returned as a string.

## Syntax

GenerateGUID ( )

## Applies To

- [ISWiProject](#)

## ISWiSuiteEvent Method (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the Suite/Advanced UI projects.

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteEvent accesses a specific event in the project.

## Syntax

ISWiSuiteEvent (EventType as ISWiSuiteEventType) as ISWiSuiteEvent

## Parameters

**Table 22** • ISWiSuiteEvent Method Parameters

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>         | <p>Specify the type of event. Available options are:</p> <ul style="list-style-type: none"><li>● <b>esetOnBegin (0)</b>—The OnBegin event is the first event in a Suite/Advanced UI installation. Actions that are scheduled for this event are executed during all modes (install, maintenance, repair, etc.) unless the conditional statement that is defined for the action evaluates as false.</li><li>● <b>esetOnResuming (1)</b>—The OnResuming event launches its actions when a Suite/Advanced UI installation is resuming after the target machine has been restarted.</li><li>● <b>esetOnStaging (2)</b>—The OnStaging event launches its actions immediately before the Suite/Advanced UI installation is staged; that is, before the Suite/Advanced UI installation downloads its package (if applicable), extracts its packages from the Setup.exe file (if applicable), and copies its packages to a directory that the end user specifies on the BrowseStageFolder wizard page or by setting the <b>ISRootStagePath</b> property through the command line.</li><li>● <b>esetOnStaged (3)</b>—The OnStaged event launches its actions after the Suite/Advanced UI installation has downloaded its packages (if applicable), extracted them from the Setup.exe file, and copied them to the staging directory.</li><li>● <b>esetOnPackagesConfiguring (4)</b>—The OnPackagesConfiguring event launches its actions immediately before the packages in the Suite/Advanced UI installation are being installed, modified, repaired, or removed.</li><li>● <b>esetOnPackagesConfigured (5)</b>—The OnPackagesConfigured event launches its actions when the packages in the Suite/Advanced UI installation have been installed, modified, repaired, or removed.</li></ul> |
| <b>Type (cont.)</b> | <ul style="list-style-type: none"><li>● <b>esetOnRebooting (6)</b>—The OnRebooting event launches its actions immediately before the Suite/Advanced UI installation triggers a restart of the machine.</li><li>● <b>esetOnEnd (7)</b>—The OnEnd event launches its actions immediately before the end of a successful Suite/Advanced UI installation. If the end user cancels the Suite/Advanced UI installation or the installation encounters an error, the OnEnd event does not run.</li><li>● <b>esetOnPackageConfiguring (8)</b>—This event launches the actions that the Suite/Advanced UI installation should launch before installing, removing, repairing, or modifying a package.</li><li>● <b>esetOnPackageConfigured (9)</b>—This event launches the actions that the Suite/Advanced UI installation should launch after installing, removing, repairing, or modifying a package.</li></ul> <p>For more information, see <a href="#">Types of Events in a Suite/Advanced UI Installation</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Applies To

- ISWiProject

## OpenProject Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

To open your Advanced UI or Suite/Advanced UI project so that you can modify it through the automation interface, call OpenProject with the fully qualified path to your .issuite file. This method is equivalent to loading a project in InstallShield.

**Note** ▪ The OpenProject method fails if the project is open in InstallShield.

## Syntax

OpenProject (strISWiProjectFile As String, Optional ByVal bReadOnly As Boolean) As Long

## Parameters

**Table 23** ▪ OpenProject Method Parameters

| Parameter                 | Description                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>strISWiProjectFile</b> | Enter the fully qualified path to the project file (.issuite).                                                                                                      |
| <b>bReadOnly</b>          | Determines whether the project is opened with write privileges. True opens the project as a read-only file. The default value for this optional parameter is False. |

Return Values and Errors

**Table 24** ▪ OpenProject Method Return Values and Errors

| Return Value | Description                                                     |
|--------------|-----------------------------------------------------------------|
| <b>0</b>     | The project was successfully opened.                            |
| <b>1</b>     | The project was opened, but it is locked by some other process. |

**Table 24** ▪ OpenProject Method Return Values and Errors (cont.)

| Return Value    | Description                                                                       |
|-----------------|-----------------------------------------------------------------------------------|
| 2               | Attempted to open project for write access, but project opened in read-only mode. |
| Error Code 1100 | Unable to open file: %1. Ensure that the file is a valid InstallShield project.   |

### Example

The following Visual Basic lines demonstrate this method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.issuite"
' Modify project here.
pProj.SaveProject
pProj.CloseProject
```

### Applies To

- [ISWiProject](#)

## SaveProject Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

To save any changes that you have made to your Advanced UI or Suite/Advanced UI project file through the automation interface, call the SaveProject method.

### Syntax

SaveProject ( )

## Return Values and Errors

**Table 25** ▪ SaveProject Method Values

| Return Value             | Description                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------|
| <b>ERROR_SUCCESS (0)</b> | Project is saved.                                                                                   |
| <b>Error Code 1104</b>   | Unable to save file: %1. The project is open in read-only mode or is being used by another process. |

## ISWiLanguage Object (Advanced UI and Suite/Advanced UI)

**Edition** ▪ Support for multilanguage installations is available with InstallShield Premier Edition.

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiLanguage object represents a language whose string entries are included in the project; it provides access to the translated strings.

To include or exclude languages, use the IsIncluded property on each relevant ISWiLanguage object.

## Members

**Table 26** • ISWiLanguage Object Members

| Name                     | Type                              | Description                                                    |
|--------------------------|-----------------------------------|----------------------------------------------------------------|
| <b>AddStringEntry</b>    | Method                            | Adds a new string entry to a language.                         |
| <b>DeleteStringEntry</b> | Method                            | Removes a string entry from the project.                       |
| <b>Id</b>                | Read-Only<br>String<br>Property   | Gets the identifier of the language.                           |
| <b>IsIncluded</b>        | Read-Write<br>Boolean<br>Property | Includes or excludes a language, or checks its current status. |
| <b>Name</b>              | Read-Only<br>String<br>Property   | Gets the name of the current language.                         |

## Applies To

## AddStringEntry Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddStringEntry method adds a new string entry to a language.

## Syntax

AddStringEntry (StringId) As ISWiStringEntry

## Parameters

**Table 27** ▪ AddStringEntry Method Parameters

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| StringId  | Specify the identifier for the string entry. |

## Applies To

- ISWiLanguage

## DeleteStringEntry Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteStringEntry method removes a string entry from the project.

## Syntax

DeleteStringEntry (StringEntry As ISWiStringEntry)

## Parameters

**Table 28** ▪ DeleteStringEntry Method Parameters

| Parameter   | Description                                                                  |
|-------------|------------------------------------------------------------------------------|
| StringEntry | Specify the ISWiStringEntry object that you want to remove from the project. |

## Applies To

- ISWiLanguage

## ISWiPathVariable Object (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

---

**Edition** ▪ The *Advanced UI* project type is available in the Professional edition of InstallShield. The *Suite/Advanced UI* project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The `ISWiPathVariable` object represents a path variable that is included in the project. Path variables help make projects' build paths more portable across machines.

To add or remove path variables, call `ISWiProject.AddPathVariable` or `ISWiProject.DeletePathVariable`.

---

**Important** ▪ Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see [Predefined Path Variables](#).

## Members

**Table 29** • ISWiPathVariable Object Members

| Name               | Type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>        | Read-Write String Property  | Gets or sets the name of the path variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>PathVarType</b> | Read-Write Integer Property | <p>This enumerated integer property gets or sets the type of the path variable. Available values are:</p> <ul style="list-style-type: none"><li>● <b>epvtPreDefined (1)</b>—Predefined path variables are variables that are set to certain standard Windows directories. These variables cannot be renamed or modified, but they can be used in your installation project to point to predefined directories.</li><li>● <b>epvtCustom (2)</b>—Custom path variables are sometimes referred to as <i>standard path variables</i> or <i>user-defined variables</i>. These variable types are defined through InstallShield. These variables do not rely on any outside sources, such as the registry or system paths.</li><li>● <b>epvtEnvironment (4)</b>—Environment path variables are based on the values of your system's environment variables. You can set an environment path variable in your project to an existing environment variable on your machine.</li><li>● <b>epvtRegistry (8)</b>—Registry path variables enable you to define your own variables based on the default value of a specified registry key. The registry key must already be present when you set a path variable to the value of the key.</li></ul> |
| <b>TestValue</b>   | Read-Write String Property  | Gets or sets the test value of the path variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 29 ■ ISWiPathVariable Object Members (cont.)

| Name          | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value         | Read-Write<br>String<br>Property | <p>Gets or sets the value of the path variable.</p> <p><b>For Standard Path Variables</b></p> <p>For standard variables, enter the directory to which you would like your variable to point.</p> <div></div> <p><b>Note</b> ■ You can also refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called <i>MyRoot</i> with a value of <i>C:\</i>, you can refer to it in a path variable definition for another variable, such as <i>Games</i>. The actual path for the <i>Games</i> variable might be <i>C:\Programs\GameFiles</i>, but you can define <i>Games</i> as <i>&lt;MyRoot&gt;\Programs\GameFiles</i>. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining <i>Games</i> as <i>&lt;MyRoot&gt;\Programs\&lt;Games&gt;</i> actually results in <i>Games</i> defined as <i>C:\Programs\&lt;Games&gt;</i>.</p> |
| Value (cont.) |                                  | <p><b>For Registry Path Variables</b></p> <p>Enter the complete registry key, with the final “subkey” being the name of the value whose data contains the folder. For example, define <i>MyRegVar</i> as follows:</p> <p>HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue</p> <p>Assume that TestKey has the following subkey and values:</p> <pre>[HKEY_LOCAL_MACHINE\SOFTWARE\TestKey] @="C:\\MyPath1" "TestValue"="C:\\MyPath2" [HKEY_LOCAL_MACHINE\Software\TestKey\TestValue] @="C:\\MyPath3"</pre> <p>Even though HKEY_LOCAL_MACHINE\SOFTWARE\TestKey has a subkey called TestValue, <i>MyRegVar</i> points to the value TestValue, and the current value will be <i>C:\MyPath2</i>. (Note, however, that if a value named TestValue does not exist, InstallShield reads the default value (<i>C:\MyPath3</i>) of the subkey HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue.)</p> <p><b>For Environment Path Variables</b></p> <p>For environment path variables, enter the name of the variable as it appears on the Environment dialog box.</p>                             |

## ISWiProperty Object (Advanced UI and Suite/Advanced UI)

---

**Project** - This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

---

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiProperty object represents an Advanced UI or Suite/Advanced UI property. You can retrieve a property by specifying an item in the ISWiProperties collection.

**Table 30** • ISWiProperty Object Members

| Name                       | Type                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Comments</b>            | Read-Write<br>String<br>Property  | Gets or sets an internal note about the string entry. The comments are not displayed at run time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>FormatPropertyValue</b> | Read-Write<br>Boolean<br>Property | <p>Gets or sets the check box in the Formatted column in the Property Manager view. The check box that lets you indicate whether the value is a formatted expression that contains property names, environment variable references, or other special strings that you want to be resolved at run time. The run-time resolution occurs early at run time, before the installation executes the actions in the OnBegin event.</p> <p>To leave the property value as is at run time, set this property equal to False. Square brackets and other characters have no special meaning.</p> <p>To replace the formatted expressions at run time, set this property equal to True.</p> <p>To learn about the syntax that is available for formatted expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> |
| <b>Name</b>                | Read-Write<br>String<br>Property  | Gets or sets the name of the Advanced UI or Suite/Advanced UI property.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Value</b>               | Read-Write<br>String<br>Property  | Gets or sets the value of the Advanced UI or Suite/Advanced UI property.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Applies To

- ISWiProject

## ISWiSetupFile Object (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSetupFile object represents a support file in your project.

To add or remove support files, call ISWiProject.AddSetupFile or ISWiProject.DeleteSetupFile.

## Members

**Table 31** • ISWiSetupFile Object Members

| Name            | Type                       | Description                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FileName</b> | Read-only String Property  | Gets the name of the support file (without the path).                                                                                                                                                                                                                                                                                        |
| <b>Language</b> | Read-Write String Property | Gets the string that identifies the language identifier for the support file; for example:<br><br><code>m_pFile.Language = "1033"</code>                                                                                                                                                                                                     |
| <b>Path</b>     | Read-only String Property  | Gets the fully qualified path (including the file name) of the support file's source location.<br><br>Instead of hard-coding a path, you can use a path variable that is defined in the Path Variables view or part of the ISWiPathVariables collection. At build time, InstallShield replaces the path variable with the appropriate value. |
| <b>Target</b>   | Read-Write String Property | Gets or sets the support file's target directory within SETUPSUPPORTDIR. The following line specifies the support file to be stored in the MyFolder1\MyFolder2 folder under SETUPSUPPORTDIR:<br><br><code>m_pFile.Target = "MyFolder1\MyFolder2"</code>                                                                                      |

## Applies To

- ISWiProject

## ISWiSuiteAction Object (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to Suite/Advanced UI projects.

---

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteAction object represents an action in the Suite/Advanced UI project.

To add or remove actions, call ISWiProject.AddSuiteAction or ISWiProject.DeleteAction. Schedule actions by calling ISWiSuiteEvent.AddSuiteAction Ref or ISWiSuiteEvent.DeleteSuiteActionRef.

Note that some ISWiSuiteAction properties are applicable to only certain action types.

## Members

**Table 32** ▪ ISWiSuiteAction Object Members

| Name              | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AbortCode</b>  | Read-Write String Property | <br><b>Note</b> ▪ <i>This property applies to .exe actions.</i><br><br>Gets or sets a comma-delimited list of the codes that the action could return when the installation should be aborted. Note that if the action cannot be launched or loaded, the installation is aborted.<br><br>This property is available if the value of the action's WaitForExit property is True.                                                                                                         |
| <b>ActionName</b> | Read-Only String Property  | Gets or sets the name of the action.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Arguments</b>  | Read-Write String Property | <br><b>Note</b> ▪ <i>This property applies to .exe actions.</i><br><br>If appropriate, gets or sets the command-line parameters that should be used with the action. Separate multiple parameters with spaces.                                                                                                                                                                                                                                                                        |
| <b>CancelCode</b> | Read-Write String Property | <br><b>Note</b> ▪ <i>This property applies to .exe actions.</i><br><br>Gets or sets a comma-delimited list of the codes that the action could return when the installation should be cancelled.<br><br>This property is available if the value of the action's WaitForExit property is True.                                                                                                                                                                                        |
| <b>Class</b>      | Read-Write String Property | <br><b>Note</b> ▪ <i>This property applies to managed-code and .NET Core actions.</i><br><br>Gets or sets the name of the class for the managed method that you want the selected action to call.<br><br>To learn more, see the following: <ul style="list-style-type: none"><li>● <a href="#">Working with a Managed-Code Action in a Suite/Advanced UI Installation.</a></li><li>● <a href="#">Working with a .NET Core Action in a Suite/Advanced UI Installation.</a></li></ul> |

**Table 32** ▪ ISWiSuiteAction Object Members (cont.)

| Name                       | Type                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DefaultResponse</b>     | Read-Write<br>Integer<br>Property |  <p><b>Note</b> ▪ <i>This property applies to .exe actions.</i></p> <p>Gets or sets a string that describes how you want the installation to respond if the code that the action returns is not specified for the IgnoreCode, AbortCode, RebootCode, or CancelCode properties. Available values are:</p> <ul style="list-style-type: none"> <li>● <b>esadcIgnore (0)</b>—The installation proceeds with the next part of the installation. This is the default option.</li> <li>● <b>esadcAbort (1)</b>—The installation is aborted.</li> <li>● <b>esadcReboot (2)</b>—The target system is restarted.</li> <li>● <b>esadcCancel (3)</b>—The installation is cancelled.</li> </ul> <p>This property is available if the value of the action's WaitForExit property is True.</p>                                                                                                                                                                                                           |
| <b>FormatPropertyValue</b> | Read-Write<br>Boolean<br>Property |  <p><b>Note</b> ▪ <i>This property applies to actions that set a property.</i></p> <p>Gets or sets the value of the Format Property Value setting in the Events view. This setting lets you indicate whether the value that you enter in the Property Value setting (or through the PropValue property in the automation interface) is a formatted expression that contains property names, environment variable references, or other special strings that you want to be resolved at run time. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>True</b>—Replace the formatted expressions at run time.</li> <li>● <b>False</b>—Leave the property value as is at run time. The value that you are entering does not include formatted expressions.</li> </ul> <p>To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> |
| <b>FunctionName</b>        | Read-Write<br>String<br>Property  |  <p><b>Note</b> ▪ <i>This property applies to DLL and InstallScript actions.</i></p> <p>For a DLL action: Gets or sets the name of the function in the DLL that you would like to call.</p> <p>For an InstallScript action: Gets or sets the InstallScript function that you want to call.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 32** ▪ ISWiSuiteAction Object Members (cont.)

| Name              | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IgnoreCode</b> | Read-Write<br>String<br>Property |  <p><b>Note</b> ▪ <i>This property applies to .exe actions.</i></p> <p>Gets or sets a comma-delimited list of the codes that the action could return when the installation should proceed with the next part of the installation.</p> <p>This property is available if the value of the action's WaitForExit property is True.</p>                                                                                                                                                                                                                                                                                                      |
| <b>Method</b>     | Read-Write<br>String<br>Property |  <p><b>Note</b> ▪ <i>This property applies to managed-code and .NET Core actions.</i></p> <p>Gets or sets the public method that you want the selected action to call.</p> <p>To learn more, see the following:</p> <ul style="list-style-type: none"> <li>• <a href="#">Working with a Managed-Code Action in a Suite/Advanced UI Installation.</a></li> <li>• <a href="#">Working with a .NET Core Action in a Suite/Advanced UI Installation.</a></li> </ul>                                                                                                                                                                         |
| <b>PropName</b>   | Read-Write<br>String<br>Property |  <p><b>Note</b> ▪ <i>This property applies to actions that set a property.</i></p> <p>Gets or sets the property name.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>PropValue</b>  | Read-Write<br>String<br>Property |  <p><b>Note</b> ▪ <i>This property applies to actions that set a property.</i></p> <p>Gets or sets the value of the property.</p> <p>If you select True for the FormatPropertyValue property, the value that you enter can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time.</a></p> |

**Table 32** ▪ ISWiSuiteAction Object Members (cont.)

| Name                          | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RebootCode</b>             | Read-Write<br>String<br>Property |  <p><b>Note</b> ▪ <i>This property applies to .exe actions.</i></p> <p>Gets or sets a comma-delimited list of the codes that the action could return when the target system should be restarted.</p> <p>This property is available if the value of the action's WaitForExit property is True.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>RequireAdminPrivileges</b> | Read-Only<br>Boolean<br>Property | <p>Gets or sets the value of the Requires Administrative Privileges setting in the Events view. This setting indicates whether this action requires administrative privileges on systems that have Windows Vista or later or Windows Server 2008 or later.</p> <p>To learn more, see <a href="#">Minimizing the Number of User Account Control Prompts During Advanced UI and Suite/Advanced UI Installations</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SourcePath</b>             | Read-Write<br>String<br>Property |  <p><b>Note</b> ▪ <i>This property applies to PowerShell actions.</i></p> <p>Gets or sets the source path to the PowerShell script (.ps1) that you want to use for your action.</p> <p>If the file is not present on target systems at run time, and if none of the packages in your Suite/Advanced UI installation are going to install it, you can reference a file that is included in your project as a support file. At run time, the file is available on the target system only during your product's installation process.</p> <p>Instead of hard-coding a location, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.</p> |
| <b>TargetFile</b>             | Read-Write<br>String<br>Property |  <p><b>Note</b> ▪ <i>This property applies to .exe, DLL, managed-code, and .NET Core actions.</i></p> <p>Gets or sets the run-time path to the file that you want to use for your action.</p> <p>If the file is not present on target systems at run time, and if none of the packages in your Suite/Advanced UI installation are going to install it, you can reference a file that is included in your project as a support file. At run time, the file is available on the target system only during your product's installation process.</p>                                                                                                                                                                                           |

## ISWiSuiteActionRef Object (Advanced UI and Suite/Advanced UI)

**Project** ▪ *This information applies to the Suite/Advanced UI projects.*

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteActionRef object represents a reference to the scheduling of an action during a Suite/Advanced UI event. You can schedule an action multiple times—even in a single event.

To schedule actions, call ISWiSuiteEvent.AddSuiteActionRef. To remove the references to the scheduling of actions, call ISWiSuiteEvent.DeleteSuiteActionRef.

## Members

**Table 33** - ISWiSuiteActionRef Object Members

| Name               | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DisplayText</b> | Read-Write String Property | <br><b>Note</b> - This property applies to .exe, DLL, PowerShell, InstallScript, and managed-code actions.<br><br>Gets or sets the text that describes the selected action. For example, if the action is running a script that configures the target system, you could enter the following string:<br><br>Configuring the system<br><br>If the installation launches the action when the InstallationProgress wizard page is displayed, the text that you enter is displayed on the wizard page. |
| <b>MoveTo</b>      | Method                     | Reschedules a Suite/Advanced UI action to occur directly after the specified other action.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Name</b>        | Read-only String Property  | Gets the name of the action that is scheduled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## MoveTo Method (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the Suite/Advanced UI projects.

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The MoveTo method reschedules a Suite/Advanced UI action to occur directly after the specified other action.

## Syntax

MoveTo (PrecedingActionRef As ISWiSuiteActionRef)

## Parameters

**Table 34** ▪ MoveTo Method Parameters

| Parameter                 | Description                                                                                                                         |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>PrecedingActionRef</b> | Specifies the action that precedes the action that you want to reschedule. The default value of Nothing indicates the top position. |

# ISWiSuiteCondition Object (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteCondition object represents the following types of conditions:

- Exit condition (used for the Condition property of the [ISWiSuiteExitCondition object](#))
- Feature condition (used for the Condition property of the [ISWiSuiteFeature object](#))
- Detection condition (used for the DetectionCondition property of the [ISWiSuitePackage object](#))
- Eligibility condition (used for the EligibleCondition property of the [ISWiSuitePackage object](#))

The ISWiSuiteCondition object can also exist in the Conditions collection of an All, Any, or None condition group.

To add or remove conditions from a condition group, call AddCondition, AddGroup, AddExtensionCondition, or DeleteCondition.

| Name        | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b> | Read-only<br>Integer<br>Property | <p>Gets the type of condition, condition group, or condition check. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>esctAll (0)</b>—An All condition group operates like a logical AND operation. All of the conditions that are in the All group must evaluate to true in order for the condition group to evaluate to true.</li> <li>● <b>esctAny (1)</b>—An Any condition group operates like a logical OR operation. If any of the conditions that are in the Any group evaluate to true, the entire condition group evaluates to true. If none of the conditions that are in the Any group evaluate to true, the entire condition group evaluates to false.</li> <li>● <b>esctNone (2)</b>—A None condition group operates like a logical NOR operation. If none of the conditions that are in the None group evaluate to true, the entire condition group evaluates to true. If any of the conditions that are in the None condition group evaluate to true, the entire condition group evaluates to false. Note that if the None condition group consists of only one conditional statement, it operates like a logical NOT operation.</li> <li>● <b>esctBuiltin (11)</b>—A built-in condition check has one or more subsettings. Examples of the built-in condition checks are Platform, File Exists, Eligible Package, and Feature Operation.</li> <li>● <b>esctExtension (21)</b>—An extension condition uses a C/C++ DLL that you created to implement your own custom condition that checks target systems for factors that the other types of condition checks do not evaluate.</li> </ul> <p>To identify group conditions, use the following:</p> <p><code>pCondition.Type &lt; 10</code></p> |

## Applies To

- ISWiSuiteExitCondition

- ISWiSuitePackage

## AddCondition Method (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddCondition method adds a condition to a condition group.

To add an extension condition to a condition group, use the [AddExtensionCondition method](#).

### Syntax

```
AddCondition (ConditionCheckName As String) As ISWiSuiteCondition
```

## Parameters

**Table 36** • AddCondition Method Parameters

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ConditionCheckName</b> | <p>Specify the name of the type of condition check. Available options are:</p> <ul style="list-style-type: none"><li>● <b>Platform</b>—Check target systems for one or more characteristics such as the operating system version, the architecture, and other platform details on target systems. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">Platform Condition Settings</a>.</li><li>● <b>FileExists</b>—Check target systems for the presence of a particular file. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">File Exists Condition Settings</a>.</li><li>● <b>FileValue</b>—Check target systems for specific information—date, version number, or content—for a particular file. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">File Comparison Condition Settings</a>.</li><li>● <b>RegistryExists</b>—Check target systems for the presence of a particular registry key, and optionally a specific value name. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">Registry Exists Condition Settings</a>.</li><li>● <b>RegistryValue</b>—Check target systems for specific information—DWORD, QWORD, string, multistring, file version, or product version—for a particular registry entry. If you do not specify a value name, the default value for the key that you specify is used for the comparison. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">Registry Comparison Condition Settings</a>.</li><li>● <b>PropertyValue</b>—Check the value of a particular built-in Advanced UI or Suite/Advanced UI property, or a property that is defined in the Property Manager view. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">Property Comparison Condition Settings</a>.</li><li>● <b>MsiInstalled</b>—Check target systems for the presence of a product that was installed by a particular .msi package. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">MSI Package Condition Settings</a>.</li><li>● <b>MsiRelated</b>—Check target systems for the presence of a version of a product that you want to update, or for the presence of future versions of a product that you do not want to downgrade. In either case, the product whose presence is being checked is installed by an .msi package. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">MSI Upgrade Condition Settings</a>.</li></ul> |

**Table 36** ▪ AddCondition Method Parameters (cont.)

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ConditionCheckName (cont.)</b> | <ul style="list-style-type: none"> <li>● <b>ParcelRef</b>—Check whether a different package or a feature in the Advanced UI or Suite/Advanced UI installation is eligible for installation on a target system. For example, if a patch package is eligible for installation only if the base package is eligible for installation, you can create an Eligible Package condition to tie the patch's eligibility to the base package's eligibility. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">Eligible Package Condition Setting</a>.</li> <li>● <b>IsInstalled</b>—Check target systems for the presence of a product that was installed by a particular InstallScript package. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">InstallScript Package Condition Settings</a>.</li> <li>● <b>Locale</b>—Match one or more locale-related settings on target systems. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">Locale Condition Settings</a>.</li> <li>● <b>SuiteInstalled</b>—Check whether a particular version of an Advanced UI or Suite/Advanced UI installation is already installed on a target system. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">Suite Installed Condition Settings</a>.</li> <li>● <b>AppxInstalled</b>—Check target systems for the presence of a particular Windows App. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">Windows App Package Condition Settings</a>.</li> <li>● <b>ParcelAction</b>—Check the target state of a particular package in the Suite/Advanced UI installation. This type of condition is available only for actions that are associated with an event in the Events view or Packages view. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">Package Operation Condition Settings</a>.</li> <li>● <b>FeatureAction</b>—Check the target state of a particular feature in the Suite/Advanced UI installation. This type of condition is available only for actions that are associated with an event in the Events view or Packages view. For descriptions of each of the settings that are displayed for this type of condition check, see <a href="#">Feature Operation Condition Settings</a>.</li> </ul> |

**Project** ▪ The *ParcelAction* and *FeatureAction* type of conditions are available in Suite/Advanced UI projects.

## Applies To

- [ISWiSuiteCondition](#)

## AddExtensionCondition Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddExtensionCondition method adds an extension condition to a condition group.

### Syntax

```
AddExtensionCondition (ConditionCheckName As String, Resource as String) As ISWiSuiteCondition
```

### Parameters

**Table 37** ▪ AddExtensionCondition Method Parameters

| Parameter                 | Description                                                                          |
|---------------------------|--------------------------------------------------------------------------------------|
| <b>ConditionCheckName</b> | Specify the name of the condition; this is part of the name of the DLL entry points. |
| <b>Resource</b>           | Specify the name of the DLL file. For the other types of built-in conditions.        |

### Applies To

- [ISWiSuiteCondition](#)

## AddGroup Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddGroup method adds an All, Any, or None operator to a setting for a condition group.

## Syntax

```
AddGroup (GroupType As ISWiSuiteConditionType) As ISWiSuiteCondition
```

## Parameters

**Table 38** • AddGroup Method Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GroupType</b> | <p>Specify the operator that you are adding to a setting for a condition group. Available options are:</p> <ul style="list-style-type: none"><li>● <b>esctAll (0)</b>—An All condition group operates like a logical AND operation. All of the conditions that are in the All group must evaluate to true in order for the condition group to evaluate to true.</li><li>● <b>esctAny (1)</b>—An Any condition group operates like a logical OR operation. If any of the conditions that are in the Any group evaluate to true, the entire condition group evaluates to true. If none of the conditions that are in the Any group evaluate to true, the entire condition group evaluates to false.</li><li>● <b>esctNone (2)</b>—A None condition group operates like a logical NOR operation. If none of the conditions that are in the None group evaluate to true, the entire condition group evaluates to true. If any of the conditions that are in the None condition group evaluate to true, the entire condition group evaluates to false. Note that if the None condition group consists of only one conditional statement, it operates like a logical NOT operation.</li></ul> |

## Applies To

- **ISWiSuiteCondition**

## AddParameter Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddParameter method adds a parameter for an extension condition to a conditional statement.

## Syntax

```
AddParameter (Name As String) As ISWiSuiteConditionParameter
```

## Parameters

**Table 39** ▪ AddParameter Method Parameters

| Parameter   | Description                                                                       |
|-------------|-----------------------------------------------------------------------------------|
| <b>Name</b> | Specify the name of the parameter that you are adding for an extension condition. |

## Applies To

- [ISWiSuiteCondition](#)

## ChangeGroupType Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ChangeGroupType method changes the All, Any, or None operator in a condition group.

## Syntax

ChangeGroupType (GroupType As ISWiSuiteConditionType)

## Parameters

**Table 40** ▪ ChangeGroupType Method Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Note that if the None condition group consists of only one conditional statement, it operates like a logical NOT operation.</li></ul> |

## Applies To

- **ISWiSuiteCondition**

## DeleteCondition Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteCondition method removes a condition object (a built-in condition, an extension condition, or a condition group).

## Syntax

DeleteCondition (pCondition As ISWiSuiteCondition)

## Parameters

**Table 41** ▪ DeleteCondition Method Parameters

| Parameter         | Description                                                                      |
|-------------------|----------------------------------------------------------------------------------|
| <b>pCondition</b> | Specify the ISWiSuiteCondition object for the condition that you want to remove. |

## Applies To

- [ISWiSuiteCondition](#)

## DeleteParameter Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteParameter method removes a parameter for an extension condition from a conditional statement.

## Syntax

DeleteParameter (pParam As ISWiSuiteConditionParameter)

## Parameters

**Table 42** ▪ DeleteParameter Method Parameters

| Parameter     | Description                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>pParam</b> | Specify the ISWiSuiteConditionParameter object that you want to remove from the conditional statement for an extension condition. |

## Applies To

- [ISWiSuiteCondition](#)

## Move Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The Move method moves a condition or a condition group within a condition tree.

## Syntax

Move (Direction As ISWiDirection)

## Parameters

**Table 43** ▪ Move Method Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Direction</b> | Specify the direction in which you want to move a condition or a condition group within a condition tree. Available options are: <ul style="list-style-type: none"> <li>• <b>edUp (0)</b>—Move the item up in the condition tree.</li> <li>• <b>edDown (1)</b>—Move the item down in the condition tree.</li> <li>• <b>edLeft (2)</b>—Move the item to the left in the condition tree.</li> <li>• <b>edRight (3)</b>—Move the item to the right in the condition tree.</li> </ul> |

# ISWiSuiteConditionParameter Object (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteConditionParameter object represents a parameter for a condition check. It is the equivalent of the value that is configured in a condition subsetting for a conditional statement. You can retrieve a parameter value by specifying an item in the ISWiSuiteConditionParameters collection.

The ISWiSuiteConditionParameters collection contains all of the available parameters for built-in conditions. To add or remove parameters for an extension condition, call ISWiSuiteCondition.AddParameter or ISWiSuiteCondition.DeleteParameter.

## Members

**Table 44** • ISWiSuiteConditionParameter Object Members

| Name           | Type                             | Description                                                                                                                                                                            |

# ISWiSuiteDFLFilter Object (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- [Advanced UI](#)
- [Suite/Advanced UI](#)

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteDFLFilter object represents a filter for a dynamic link that includes additional files that a package in an Advanced UI or Suite/Advanced UI project requires.

## CanMove Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The CanMove method indicates whether a filter can move up or down in the filter criteria; the result is returned as a Boolean value.

## Syntax

CanMove (Direction As ISWiDirection)

## Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Direction</b> | Specify one of the following ISWiDirection values to check whether it is possible to move the filter in this direction within the list of filter criteria: <ul style="list-style-type: none"><li>● <b>edUp (0)</b>—Verify whether it is possible to move the filter higher in the list of filter criteria.</li><li>● <b>edDown (1)</b>—Verify whether it is possible to move the filter lower in the list of filter criteria.</li></ul> |

## Applies To

- ISWiSuiteDFLFilter

## MoveDown Method (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The MoveDown method moves a filter down below the filter that follows it.

## Syntax

MoveDown ( )

## Applies To

- ISWiSuiteDFLFilter

## MoveUp Method (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The MoveUp method moves a filter up above the filter that precedes it.

## Syntax

MoveUp ( )

## Applies To

- ISWiSuiteDFLFilter

## ISWiSuiteDynamicFileLink Object (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteDynamicFileLink object represents a dynamic link for the additional files that a package in an Advanced UI or Suite/Advanced UI project requires.

To add or remove dynamic links, call AddDynamicFileLink or DeleteDynamicFileLink.

## Members

**Table 47** ▪ ISWiSuiteDynamicFileLink Object Members

| Name                       | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddFilter</b>           | Method                     | Adds a filter to a dynamic link for the additional files that a package in an Advanced UI or Suite/Advanced UI project requires.                                                                                                                                                                                                                                                                                                  |
| <b>DeleteFilter</b>        | Method                     | Removes a filter from a dynamic link.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ISWiSuiteDFLFilters</b> | Collection                 | Contains all of the filters that are associated with a dynamic link for the additional files that a package requires.                                                                                                                                                                                                                                                                                                             |
| <b>Source</b>              | Read-Write String Property | <p>Gets or sets the path to the source folder that contains the package that you want to include in your Advanced UI or Suite/Advanced UI project. It also is the source of dynamically included files for the package.</p> <p>Instead of hard-coding a location, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.</p> |

## Applies To

- **ISWiSuiteFolder**

## AddFilter Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddFilter method adds a filter to a dynamic link for the additional files that a package requires.

## Syntax

```
AddFilter (FilterType As ISWiSuiteDFLFilterType) As ISWiSuiteDFLFilter
```

## Parameters

**Table 48** ▪ AddFilter Method Parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FilterType</b> | Specify the type of filter that you want to add to a dynamic link. Available options are: <ul style="list-style-type: none"><li>● <b>esdfIncFolder (301)</b>—Include folders that match the specified filter.</li><li>● <b>esdfExcFolder (302)</b>—Exclude folders that match the specified filter.</li><li>● <b>esdfIncFile (303)</b>—Include files that match the specified filter.</li><li>● <b>esdfExcFile (304)</b>—Exclude files that match the specified filter.</li></ul> |

## Applies To

- [ISWiSuiteDynamicFileLink](#)

## DeleteFilter Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteFilter method removes a filter from a dynamic link for the additional files that a package requires.

## Syntax

```
DeleteFilter (Filter As ISWiSuiteDFLFilter)
```

## Parameters

**Table 49** ▪ DeleteFilter Method Parameters

| Parameter     | Description                                                    |
|---------------|----------------------------------------------------------------|
| <b>Filter</b> | Specify the ISWiSuiteDFLFilter object that you want to remove. |

## Applies To

# ISWiSuiteEvent Object (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the Suite/Advanced UI projects.

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteEvent object represents a Suite/Advanced UI run-time event. Actions that are scheduled for a given event are executed at run time under certain conditions.

## Members

Table 50 - ISWiSuiteEvent Object Members

| Name                 | Type       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AddSuiteActionRef    | Method     | Schedules a Suite/Advanced UI action during a run-time event.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DeleteSuiteActionRef | Method     | Removes an action from a run-time event.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ISWiSuiteActionRefs  | Collection | <div><p><b>Project</b> - This is available in Suite/Advanced UI projects.</p><p><b>Edition</b> - The Suite/Advanced UI project type is available in the Premier edition of InstallShield.</p><p>Contains all of the Suite/Advanced UI actions that are scheduled for a specific event in a package.</p></div> |

# AddSuiteActionRef Method (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddSuiteActionRef method schedules a Suite/Advanced UI action during a run-time event. You can schedule an action to run multiple times during an event if necessary.

## Syntax

AddSuiteActionRef (Action As ISWiSuiteAction)

## Parameters

**Table 51** ▪ AddSuiteActionRef Method Parameters

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| Action    | Specify the action to schedule in this event. |

## Applies To

- [ISWiSuiteEvent](#)

## DeleteSuiteActionRef Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteSuiteActionRef method removes a Suite/Advanced UI action from a run-time event.

## Syntax

DeleteSuiteActionRef (ActionRef As ISWiSuiteActionRef)

## Parameters

**Table 52** ▪ DeleteSuiteActionRef Method Parameters

| Parameter        | Description                                                                               |
|------------------|-------------------------------------------------------------------------------------------|
| <b>ActionRef</b> | Specify the action as an ISWiSuiteActionRef object that you want to delete from an event. |

## Applies To

- [ISWiSuiteEvent](#)

# ISWiSuiteExitCondition Object (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the Suite/Advanced UI projects.

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteExitCondition object represents an exit condition in the Suite/Advanced UI project.

To add or remove exit conditions, call ISWiProject.AddExitCondition or ISWiProject.DeleteExitCondition.

## Members

**Table 53** ▪ ISWiSuiteExitCondition Object Members

| Name             | Type                       | Description                                                                                                                                                                                                                                                                                                                             |
|------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Message</b>   | Read-Write String Property | Gets or sets the error message that you want the Advanced UI or Suite/Advanced UI installation to display at run time if the conditions that are defined for this message are true.                                                                                                                                                     |
| <b>Condition</b> | Read-only Object Property  | <p>This property accesses the <a href="#">ISWiSuiteCondition object</a>.</p> <p>Gets the root-level condition group (Any, All, or Not) that the Advanced UI or Suite/Advanced UI installation evaluates at run time for the exit condition.</p> <p>Exit conditions always have a condition, so there is no need to add a condition.</p> |

## Applies To

## ISWiSuiteFeature Object (Advanced UI and Suite/Advanced UI)

---

**Project** - This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

---

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteFeature object represents a root-level feature or a subfeature in an Advanced UI or Suite/Advanced UI project. You can retrieve a feature by specifying an item in the ISWiSuiteFeatures collection.

## Members

**Table 54** • ISWiSuiteFeature Object Members

| Name                         | Type                              | Description                                                                                                                                                                                                            |
|------------------------------|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddCondition</b>          | Method                            | Adds a condition to a feature without a condition.                                                                                                                                                                     |
| <b>AddSuiteSubFeature</b>    | Method                            | Adds a subfeature to an existing feature.                                                                                                                                                                              |
| <b>AllowSelectionChange</b>  | Read-Write<br>Boolean<br>Property | Gets or sets the value of the Allow UI Selection Change setting for the feature. This setting indicates whether end users should be allowed to select or deselect the feature on the InstallationFeatures wizard page. |
| <b>AttachPackage</b>         | Method                            | Associates a package in the project with a feature.                                                                                                                                                                    |
| <b>Condition</b>             | Read-only<br>Object<br>Property   | This property accesses the <a href="#">ISWiSuiteCondition</a> object.<br><br>Gets the feature's condition, if one is associated with the feature.                                                                      |
| <b>Cost</b>                  | Read-Write<br>Property            | Gets or sets how much space (in bytes) that the feature requires on the target system.                                                                                                                                 |
| <b>DeleteCondition</b>       | Method                            | Removes a condition from a feature.                                                                                                                                                                                    |
| <b>DeleteSubSuiteFeature</b> | Method                            | Removes a subfeature from a feature.                                                                                                                                                                                   |
| <b>Description</b>           | Read-Write<br>String<br>Property  | Gets or sets the description for this feature.                                                                                                                                                                         |
| <b>DisplayName</b>           | Read-Write<br>String<br>Property  | Gets or sets the name of the feature.                                                                                                                                                                                  |

**Table 54** • ISWiSuiteFeature Object Members (cont.)

| Name                     | Type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FollowParentState</b> | Read-Write Boolean Property | <p>This property is available for subfeatures; it is not available for root-level features.</p> <p>Gets or sets the value of the Follow Parent State setting for the subfeature. This setting indicates whether you want the subfeature's state to be determined by its parent feature. Available values are:</p> <ul style="list-style-type: none"> <li>● <b>True</b>—The selected subfeature will be installed whenever its parent feature is installed.</li> <li>● <b>False</b>—If the selected subfeature's parent feature is installed, the selected subfeature can be either installed or not installed. This is the default option. Note that if the selected subfeature's parent feature is not installed, the selected subfeature cannot be installed.</li> </ul> <p>This setting is especially useful if you want the subfeature to be hidden on the InstallationFeatures wizard page, but its parent feature is not hidden.</p> |
| <b>ISWiSuiteFeatures</b> | Collection                  | Contains all of the subfeatures that are assigned to a feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>ISWiSuitePackages</b> | Collection                  | Contains all of the packages that are associated with a feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Name</b>              | Read-Write String Property  | Gets or sets the name of the feature in the collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ReleaseFlags</b>      | Read-Write String Property  | <p>Gets or sets the release flags that are associated with this feature. Separate multiple flags with a comma.</p> <p>You can specify which release flags you want to use to filter the project's features in the ReleaseFlags property of ISWiRelease.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>RemovePackage</b>     | Method                      | Removes a package from a feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Visible</b>           | Read-Write Boolean Property | Gets or sets the feature's Visible setting, which specifies whether the feature will be visible on the InstallationFeatures wizard page during installation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Example

The following VBScript lines display information about a feature. Since feature can include subfeatures, the script is implemented recursively.

```
Sub WriteFeature(indent, f)
    out.WriteLine indent & f.DisplayName & " (" & f.Name & ")"

## Applies To

- [ISWiProject](#)
- [ISWiSuiteFeature](#)

## AddCondition Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddCondition method adds a condition to a feature without a condition.

## Syntax

AddCondition () As ISWiSuiteCondition

## Parameters

The AddCondition method does not take any parameters.

## Applies To

- [ISWiSuiteFeature](#)

# AddSuiteSubFeature Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddSuiteSubFeature method adds a subfeature to an existing feature in the project.

## Syntax

AddSuiteSubFeature (InternalName As String) As ISWiSuiteFeature

## Parameters

Table 55 ▪ AddSuiteSubFeature Method Parameters

| Parameter    | Description                                                                                                                                             |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| InternalName | Specify the internal name (which is displayed in the Features pane of the Feature view) of the subfeature that you want to add to the existing feature. |

## Applies To

- ISWiSuiteFeature

# AttachPackage Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AttachPackage method associates a package with a feature in the project.

## Syntax

AttachPackage (Package As ISWiSuitePackage)

## Parameters

**Table 56** ▪ AttachPackage Method Parameters

| Parameter      | Description                                                                          |
|----------------|--------------------------------------------------------------------------------------|
| <b>Package</b> | Specify the ISWiSuitePackage object that you want to be associated with the feature. |

## Applies To

- [ISWiSuiteFeature](#)

## DeleteCondition Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteCondition method removes a condition from a feature.

## Syntax

DeleteCondition ()

## Parameters

The DeleteCondition method does not take any parameters.

## Applies To

- [ISWiSuiteFeature](#)

## DeleteSuiteSubFeature Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteSuiteSubFeature method removes a subfeature from a feature in the project.

## Syntax

DeleteSuiteSubFeature (SubFeature As ISWiSuiteFeature)

## Parameters

**Table 57** - DeleteSuiteSubFeature Method Parameters

| Parameter  | Description                                                                   |
|------------|-------------------------------------------------------------------------------|
| SubFeature | Specify the ISWiSuiteFeature object that you want to remove from the feature. |

## Applies To

- [ISWiSuiteFeature](#)

## RemovePackage Method (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The RemovePackage method removes a package from a feature in the project.

## Syntax

RemovePackage (Package As ISWiSuitePackage)

## Parameters

**Table 58** ▪ RemovePackage Method Parameters

| Parameter      | Description                                                                   |
|----------------|-------------------------------------------------------------------------------|
| <b>Package</b> | Specify the ISWiSuitePackage object that you want to remove from the feature. |

## Applies To

- [ISWiSuiteFeature](#)

# ISWiSuiteFile Object (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The *Advanced UI* project type is available in the Professional edition of InstallShield. The *Suite/Advanced UI* project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteFile object represents a file in a package of an Advanced UI or Suite/Advanced UI project. You can change the file or its source path. The file's other properties are read-only.

## Members

**Table 59** ▪ ISWiSuiteFile Object Members

| Name            | Type                             | Description                                                                                                                                                                                                                                                                             |
|-----------------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FullPath</b> | Read-Only<br>String<br>Property  | Gets the full path of the file.                                                                                                                                                                                                                                                         |
| <b>LinkPath</b> | Read-Write<br>String<br>Property | Gets or sets the source path to the file.<br><br>Instead of hard-coding a path, you can use a path variable that is defined in the Path Variables view or part of the ISWiPathVariables collection. At build time, InstallShield replaces the path variable with the appropriate value. |
| <b>Modified</b> | Read-Only<br>String<br>Property  | Gets the last-modified date of the file.                                                                                                                                                                                                                                                |
| <b>Name</b>     | Read-Write<br>String<br>Property | Gets or sets the name of the file in the package.                                                                                                                                                                                                                                       |
| <b>Size</b>     | Read-only<br>Integer<br>Property | Gets the size of the file.                                                                                                                                                                                                                                                              |
| <b>Version</b>  | Read-Only<br>String<br>Property  | Gets the version number of the file.                                                                                                                                                                                                                                                    |

## Applies To

- [ISWiSuiteFolder](#)

## ISWiSuiteFolder Object (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSuiteFolder object represents a folder of files in a package of an Advanced UI or Suite/Advanced UI project.

## Members

**Table 60** ▪ ISWiSuiteFolder Object Members

| Name                             | Type                       | Description                                                                                                          |
|----------------------------------|----------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>AddDynamicFileLink</b>        | Method                     | Adds a dynamic link for the additional files that a package in an Advanced UI or Suite/Advanced UI project requires. |
| <b>AddFile</b>                   | Method                     | Adds a file to a folder in the package.                                                                              |
| <b>AddFolder</b>                 | Method                     | Adds a subfolder to a folder in the package.                                                                         |
| <b>DeleteDynamicFileLink</b>     | Method                     | Removes a dynamic link for the additional files that a package requires.                                             |
| <b>DeleteFile</b>                | Method                     | Removes a file from a folder in the package.                                                                         |
| <b>DeleteFolder</b>              | Method                     | Removes a subfolder from a folder in the package.                                                                    |
| <b>ISWiSuiteDynamicFileLinks</b> | Collection                 | Contains every dynamic file link in a folder in a package of an Advanced UI or Suite/Advanced UI project.            |
| <b>ISWiSuiteFiles</b>            | Collection                 | Contains all of the files in a folder of a package in an Advanced UI or Suite/Advanced UI project.                   |
| <b>ISWiSuiteFiles</b>            | Collection                 | Contains all of the files in the folder.                                                                             |
| <b>ISWiSuiteFolders</b>          | Collection                 | Contains all of the subfolders in the current folder.                                                                |
| <b>Name</b>                      | Read-Write String Property | Gets or sets the name of the folder in the package.                                                                  |

## Applies To

## AddFile Method (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the following project types:

- [Advanced UI](#)
- [Suite/Advanced UI](#)

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddFile method adds a file to a folder in a package of an Advanced UI or Suite/Advanced UI project.

## Syntax

AddFile (Name As String) As ISWiSuiteFile

## Parameters

**Table 62** • AddFile Method Parameters

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| Name      | Specify the name of the file that you want to add to a folder in a package. |

## Applies To

- [ISWiSuiteFolder](#)

## AddFolder Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddFolder method adds a subfolder to a folder in a package of an Advanced UI or Suite/Advanced UI project.

## Syntax

AddFolder (Name As String) As ISWiSuiteFolder

## Parameters

**Table 63** • AddFile Method Parameters

| Parameter | Description                                                                      |
|-----------|----------------------------------------------------------------------------------|
| Name      | Specify the name of the subfolder that you want to add to a folder in a package. |

## Applies To

- [ISWiSuiteFolder](#)

## DeleteDynamicFileLink Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI

- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteDynamicFileLink method removes a dynamic link for the additional files that a package requires.

## Syntax

DeleteDynamicFolderLink (DynamicFileLink As ISWiSuiteDynamicFileLink)

## Parameters

**Table 64** ▪ DeleteDynamicFolderLink Method Parameters

| Parameter              | Description                                                          |
|------------------------|----------------------------------------------------------------------|
| <b>DynamicFileLink</b> | Specify the ISWiSuiteDynamicFileLink object that you want to remove. |

## Applies To

- ISWiSuiteFolder

## DeleteFile Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteFile method removes a file from a folder in a package of an Advanced UI or Suite/Advanced UI project.

## Syntax

DeleteFile (File as ISWiSuiteFile)

## Parameters

**Table 65** • DeleteFile Method Parameters

| Parameter   | Description                                               |
|-------------|-----------------------------------------------------------|
| <b>File</b> | Specify the ISWiSuiteFile object that you want to remove. |

## Applies To

- [ISWiSuiteFolder](#)

## DeleteFolder Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteFolder method removes a subfolder from a folder in a package of an Advanced UI or Suite/Advanced UI project.

## Syntax

DeleteFolder (Name As ISWiSuiteFolder)

## Parameters

**Table 66** • DeleteFile Method Parameters

| Parameter   | Description                                                 |
|-------------|-------------------------------------------------------------|
| <b>Name</b> | Specify the ISWiSuiteFolder object that you want to remove. |

## Applies To

- [ISWiSuiteFolder](#)

## ISWiSuiteOperation Object (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

---

**Edition** ▪ *The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).*

The ISWiSuiteOperation object represents an operation on a package.

Note that some ISWiSuiteOperation items are not applicable to all types of Advanced UI or Suite/Advanced UI package files.

**Table 67** ▪ ISWiSuiteOperation Object Members

| Name           | Type                        | Type of Package File                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|-----------------------------|---------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CmdLine</b> | Read-Write String Property  | .msi, .msp, .exe, InstallScript, Basic MSI project, InstallScript project | <p>If applicable, gets or sets the command line that should be used to launch the target file whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this property.</p> <p>The value of this property can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> <p>For more information, including valid types of entries for this property, see <a href="#">Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation</a>.</p> |
| <b>Enable</b>  | Read-Write Boolean Property | Support varies                                                            | Gets or sets a value to indicate whether an operation for a package is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Name                            | Type                        | Type of Package File | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|-----------------------------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ExitBehavior</b>             | Read-Write Integer Property | .exe                 | <p>If a detection condition is still not met on a target system after the package has been run, either one of the following may be true:</p> <ul style="list-style-type: none"> <li>• The executable file package was not run successfully.</li> <li>• The detection conditions that were specified for the package were not accurate.</li> </ul> <p>For example, a detection condition may indicate that the executable file needs to be launched if a particular file does not exist on the target system. If the file is still missing even after the Advanced UI or Suite/Advanced UI installation has run the executable file package, it is possible that the condition was created erroneously.</p> <p>The ExitBehavior property indicates the behavior that should occur if one or more of the detection conditions still indicate that the package needs to be launched. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>epseDetectPrompt (0)</b>—Ask whether to continue the setup.</li> </ul> <p>The Advanced UI or Suite/Advanced UI installation displays a message box that prompts the end user to specify whether the Advanced UI or Suite/Advanced UI installation should continue.</p> <ul style="list-style-type: none"> <li>• <b>epseDetectAbort (1)</b>—Abort the setup.</li> </ul> <p>The Advanced UI or Suite/Advanced UI installation ends without proceeding further.</p> <ul style="list-style-type: none"> <li>• <b>epseDetectIgnore (2)</b>—Continue the setup.</li> </ul> <p>The Advanced UI or Suite/Advanced UI installation essentially ignores the executable file's unmet condition and proceeds to the next package in the installation (if one is required).</p> |
| <b>ForceApplicationShutdown</b> | Read-Write Boolean Property | .appx                | <p>If the selected sideloading app package (or any package that depends on this package) is in use at installation run time, you can require that the processes that are associated with the package are forced to shut down so that registration can proceed. Use this property to indicate whether you want to force application shutdown in that scenario.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Type</b> | Read-only String Property | Support varies       | <p>Gets the type of operation. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>esotInstall (1)</b>—The package is launched as a first-time installation.</li> </ul> <p>This operation is available for the following types of package files: .msi, .msp, .exe, .appx, InstallScript, Basic MSI project, and InstallScript project.</p> <li>● <b>esotRemove (2)</b>—The product that the package installed is removed.</li> <p>This operation is available for the following types of package files: .msi, .exe, .appx, InstallScript, Basic MSI project, and InstallScript project.</p> <li>● <b>esotRepair (3)</b>—The product that the package installed is repaired.</li> <p>This operation is available for the following types of package files: .msi, .exe, InstallScript, Basic MSI project, and InstallScript project.</p> <li>● <b>esotModify (4)</b>—The package is launched in maintenance mode to enable end users to install, remove, or modify the product.</li> <p>This operation is available for the following types of package files: .msi, .msp, .exe, InstallScript, Basic MSI project, and InstallScript project.</p> |

## Applies To

- ISWiSuitePackage

## ISWiSuitePackage Object (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The `ISWiSuitePackage` object represents a package or a Windows Installer transaction that is included in an Advanced UI or Suite/Advanced UI project.

To add or remove packages and transactions, call `ISWiProject.AddSuitePackage` or `ISWiProject.DeleteSuitePackage`.

---

**Important** • Note that some `ISWiSuitePackage` items are not applicable to all types of Advanced UI or Suite/Advanced UI package files. Use the `PackageType` property to determine the package type. If one of the other `ISWiSuitePackage` properties returns an empty value, that property is not applicable to that package type.

Also note that the Advanced UI project type, which is available in the Professional edition of InstallShield, does not have support for most of the types of package files; the only ones that it does support are `.msi`, `.msp`, and `InstallScript` packages.

| Name                  | Type                        | Type of Package File                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-----------------------------|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LoggingCmdLine</b> | Read-Write String Property  | .exe, InstallScript, InstallScript project                                | <p>This property is available if the value of the LoggingEnable property is True.</p> <p>Gets or sets the value of the Logging Command Line setting in the Packages view. This setting indicates the command line that the Advanced UI or Suite/Advanced UI installation should pass to the .exe package to enable the logging. Include any appropriate supported flags. If the .exe package that you are configuring supports it, include a path that references the Advanced UI or Suite/Advanced UI property ISLogDir, enclosed within square brackets, in place of the path to the directory where the log file should be created.</p> <p>For example, to generate a log file that logs everything verbosely for an .msi package that is run by a Setup.exe file that InstallShield built, enter the following command line:</p> <pre>/v"/1*v "[ISLogDir]FileName.log\ ""</pre> <p>The Advanced UI or Suite/Advanced UI installation replaces [ISLogDir] with the path to the folder that will contain the log file. The Advanced UI or Suite/Advanced UI /log command-line parameter lets end users specify the path to the directory for the package log files.</p> <p>For more information, see <a href="#">Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation</a>.</p> |
| <b>LoggingEnable</b>  | Read-Write Boolean Property | .msi, .msp, .exe, InstallScript, Basic MSI project, InstallScript project | <p>Gets or sets the Enable Logging Support setting in the Packages view. This setting indicates whether you want the package to generate a log file if the Advanced UI or Suite/Advanced UI installation is launched from the command line with the /log command-line parameter. Note that if a package does not have support for logging, it is recommended that you do not enable logging support for that package.</p> <p>If you select Yes, configure the other logging-related properties as needed.</p> <p>For more information, see <a href="#">Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 68** • ISWiSuitePackage Object Members (cont.)

| Name                        | Type                       | Type of Package File          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|----------------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LoggingMsiLogFile</b>    | Read-Write String Property | .msi, .msp, Basic MSI project | <p>This property is available if the value of the LoggingEnable property is True.</p> <p>Gets or sets the value of the Logging Command Line setting in the Packages view. This setting indicates a name for the log file. Do not include a path for the file; the Advanced UI or Suite/Advanced UI /log command-line parameter lets end users specify the directory for the package log files.</p> <p>If you leave this setting blank, the name of the log file that the installation creates is <i>PackageGUID.log</i>, where <i>PackageGUID</i> is the GUID that is assigned to the package in the Package GUID setting in the Packages view.</p> <p>For more information, see <a href="#">Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation</a>.</p> |
| <b>LoggingMsiLogOptions</b> | Read-Write String Property | .msi, .msp, Basic MSI project | <p>This property is available if the value of the LoggingEnable property is True.</p> <p>Gets or sets the value of the Log Options setting in the Packages view. This setting indicates the Windows Installer log /L flags that you want the package to use when generating the log file. For example, to generate a log file that logs everything verbosely, enter the following in this setting:</p> <p>*v</p> <p>For additional valid flags, see the <a href="#">/L description</a>.</p> <p>If you leave this setting blank, the asterisk (*) and v flags are used to generate the log file.</p> <p>For more information, see <a href="#">Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation</a>.</p>                                                 |

| Name                   | Type                       | Type of Package File                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|----------------------------|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PackageLocation</b> | Read-Write String Property | .msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project | <p>This property accesses the ISWiPackageLoc object.</p> <p>Gets or sets where the package is configured to be located. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>eplSourceMedia (0)</b>—Copy from source media. That is, store the package and its files on the source media.</li> <li>● <b>eplSetupExe (1)</b>—Extract from Setup.exe. That is, compress the package and its files into Setup.exe, to be extracted at run time, if necessary.</li> <li>● <b>eplWeb (2)</b>—Download from the Web. That is, download the package and its files (if necessary) from the URL that is specified for the package.</li> </ul> <p>If the Advanced UI or Suite/Advanced UI installation will be run uncompressed from fixed media—such as CD, DVD, or local network—use this option.</p> <p>If the entire Advanced UI or Suite/Advanced UI installation must be self-contained in Setup.exe, use this option. Note that the Web option results in smaller installations and shorter download time; however, the Setup.exe option provides for a completely self-contained installation.</p> <p>This option is recommended if your installation will be downloaded from the Internet and you want to minimize the Advanced UI or Suite/Advanced UI package size and download time. An Advanced UI or Suite/Advanced UI package is not downloaded if the correct version is already present on the target system.</p> <p>Note that you can override this property for all packages when you are configuring a release.</p> |

This setting indicates what sort of status messages are available for displaying in the user interface of the Advanced UI or Suite/Advanced UI installation. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>epsptCaptureFull (3)</b>—Action text. The Advanced UI or Suite/Advanced UI installation’s status messages include the action text from the standard actions and custom actions in the package.</li> <li>● <b>epsptCaptureFullVerbose (4)</b>—Action text and action data. The Advanced UI or Suite/Advanced UI installation’s status messages include the action text as well as action data from the standard actions and custom actions in the package.</li> </ul> <p>At run time, the Advanced UI or Suite/Advanced UI installation updates the ISParcelStatus property with the action text and, if applicable, the action data in the ISParcelStatus property, which is displayed on the InstallationProgress wizard page of the Advanced UI or Suite/Advanced UI installation by default.</p> <p>For example, when the InstallFiles action in an .msi package is executing, the ISParcelStatus property is updated with the action text “Copying new files” to inform end users about the current progress of the installation. If you choose to include action data in the status messages, the ISParcelStatus property may also be updated with action data such as the name, directory, and size of each file as it is being installed on the target system.</p> |
| <b>ReleaseFlags</b>    | Read-Write String Property | .msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project | <p>Gets or sets the release flags that are assigned to the package. Separate multiple flags with a comma.</p> <p>You can use release flags to selectively include and exclude this package from different builds of your Advanced UI or Suite/Advanced UI installation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 68** • ISWiSuitePackage Object Members (cont.)

| Name                  | Type                        | Type of Package File                                                                         | Description                                                                                                                                                                                                                               |
|-----------------------|-----------------------------|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RootFolder</b>     | Read-only Object Property   | .msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project | This property accesses the ISWiSuiteFolder object.<br><br>Gets the root folder that contains the package and its folders and files.                                                                                                       |
| <b>SharedParckage</b> | Read-Write Boolean Property | .msi, .msp, .exe, .appx, InstallScript, Basic MSI project, InstallScript project             | Gets or sets the value for the Shared setting in the Packages view. This setting indicates whether the package is shared with other products and should be removed only if no other products that are left behind are using this package. |

**Table 68** ▪ ISWiSuitePackage Object Members (cont.)

| Name               | Type                       | Type of Package File    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|----------------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>UpgradeType</b> | Read-Write String Property | .msi, Basic MSI project | <p>Gets or sets the value of the Minor Upgrade Handling setting in the Packages view. This setting indicates the behavior that should occur when an earlier version of the package is present on the target system. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>epsutNone (0)</b>—None. The Advanced UI or Suite/Advanced UI installation launches the package without running it in minor upgrade mode. That is, the Advanced UI or Suite/Advanced UI installation does not set the REINSTALL or REINSTALLMODE properties for the package.</li> <li>● <b>epsutAuto (1)</b>—Automatic. The Advanced UI or Suite/Advanced UI installation launches the package in upgrade mode by setting the REINSTALL property to <i>ALL</i> and the REINSTALLMODE property to <i>nomus</i>. It does not inform the end user that the product will be upgraded.</li> <li>● <b>epsutPrompt (2)</b>—Ask the user. The Advanced UI or Suite/Advanced UI installation displays a secondary window that asks the end user whether they want to continue. If the end user chooses to continue, the Advanced UI or Suite/Advanced UI installation launches the package in upgrade mode. If the end user chooses to not continue, the package does not run.</li> </ul> |

**Table 68** ▪ ISWiSuitePackage Object Members (cont.)

| Name                          | Type                       | Type of Package File                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>WPMPackageId</b>       | Read-Write String Property | WPM package          | <p>Gets or sets a Windows Package Manager (WPM) package ID that uniquely identifies the Windows Package Manager (WPM) package.</p> <p>You can acquire the Windows Package Manager (WPM) package ID either by searching the package manifest in the Microsoft repository or by executing the Windows Package Manager client winget command line tool with the <b>search</b> or <b>show</b> options</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>WPMSpecificVersion</b> | Read-Write String Property | WPM package          | <p>Gets or sets the specific version of the package which you want to install from the Windows Package Manager repository.</p> <p>You can use this property if the value of the <b>WPMVersionType</b> property is <b>eswvSpecificVersion (1)</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>WPMVersionType</b>     | Read-Write String Property | WPM package          | <p>This property is accessed by the <b>ISWiSuiteWpmVersions</b> object.</p> <p>Gets or sets the version of the package you want to install from the Windows Package Manager repository. Available options for this property are:</p> <ul style="list-style-type: none"> <li>● <b>eswvLatestVersion (0)</b>—Use this option to install the latest package available in the Windows Package Manager repository.</li> <li>● <b>eswvSpecificVersion (1)</b>—Use this option to install any specific package available in the Windows Package Manager repository.</li> </ul> <div>  <p><b>Note</b> • By default, the value of the <b>WPMVersionType</b> property is <b>eswvLatestVersion (0)</b> to install the latest package.</p> </div> |

## Example

The following VBScript lines demonstrate how to display information about a package in a project. Windows Installer transactions can contain multiple packages, so the script is implemented recursively.

```
Sub WritePackage(indent, p)
    If p.PackageType = -1 Then ' Transaction
        out.WriteLine indent & "Transaction:"
        For Each sp In p.ISWiSuitePackages
            WritePackage indent & " ", sp
        Next
    Else
```

```

        out.WriteLine indent & IDS(p.DisplayName) & " (" & p.Name & ")"
        out.WriteLine indent & "Type: " & p.PackageType
        out.WriteLine indent & "Description: " & p.Description
        out.WriteLine indent & "Shared: " & p.SharedPackage
        out.WriteLine indent & "Location: " & p.PackageLocation & " " & p.PackageUrl
        out.WriteLine indent & "Release Flags: " & p.ReleaseFlags
        out.WriteLine indent & "Files:"
        WriteFolder indent & " ", p.RootFolder
        out.WriteLine indent & "Detection Condition:"
        WriteCondition indent & " ", p.DetectCondition
        out.WriteLine indent & "Eligibility Condition:"
        WriteCondition indent & " ", p.EligibleCondition
    End If
End Sub

```

## Applies To

## AddDetectCondition Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddDetectCondition method adds a detection condition to a package in an Advanced UI or Suite/Advanced UI project.

The detection condition is a condition that the Advanced UI or Suite/Advanced UI installation should use to evaluate whether the package is already installed on target systems. If this does not change from false to true (or from true to false) at run time, the Advanced UI or Suite/Advanced UI installation assumes that the package failed to install (or remove) its payload. In addition, subsequent maintenance and remove operations (or subsequent maintenance and install operations) may not behave as expected.

## Syntax

```
AddDetectCondition () As ISWiSuiteCondition
```

## Parameters

The AddDetectCondition method does not take any parameters.

## Applies To

- [ISWiSuitePackage](#)

## AddEligibleCondition Method (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddEligibleConditionPackage method adds an eligibility condition to a package in an Advanced UI or Suite/Advanced UI project.

The eligibility condition is a condition that the Advanced UI or Suite/Advanced UI installation should use to determine whether the target system meets the requirements that are necessary for the package to be run. For example, if the package should be run only on 64-bit systems, you could set up an x64 platform requirement in a condition; the Advanced UI or Suite/Advanced UI installation would launch the package only on 64-bit systems. You may also want to set up an eligibility condition to prevent end users from being able to install the current package version over a future newer version.

### Syntax

```
AddEligibleCondition () As ISWiSuiteCondition
```

### Parameters

The AddEligibleConditionPackage method does not take any parameters.

### Applies To

- [ISWiSuitePackage](#)

## AddSuitePackage Method (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the Suite/Advanced UI projects.

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddSuitePackage method adds a package (an .msi package or an .msp patch) to a Windows Installer transaction in the project. It also adds the specified target file and options for adding additional files. Using this method is similar to adding a package to a transaction in the Packages view in InstallShield. You can set the properties of the new package with the ISWiSuitePackage object.

To add other types of packages to the project, see [AddSuitePackage Method \(Advanced UI and Suite/Advanced UI\)](#).

### Syntax

AddSuitePackage (PackageType As ISWiSuitePackageType, TargetFileName As String, AdditionalFiles As ISWiAdditionalFiles) As ISWiSuitePackage

### Parameters

**Table 69** ▪ AddSuitePackage Method Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PackageType</b>     | Specify the type of package that you are adding to the transaction. Available options are: <ul style="list-style-type: none"><li>● <a href="#">esptMsi (1)</a>—Windows Installer package (.msi)</li><li>● <a href="#">esptMsp (2)</a>—Windows Installer patch (.msp)</li></ul>                                                                                                                                                                                                                                                                                                                                                                      |
| <b>TargetFileName</b>  | Specify the file in the package (such as the .msi file) that the Advanced UI or Suite/Advanced UI installation should invoke.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>AdditionalFiles</b> | Specify the type of additional files that you want to add for the package. Available options are: <ul style="list-style-type: none"><li>● <a href="#">eaftNothing (0)</a>—Add nothing. This package does not need any additional files.</li><li>● <a href="#">eaftAdjacentFiles (1)</a>—Add adjacent files; that is, add the files next to this package.</li><li>● <a href="#">eaftSubFolders (2)</a>—Add files in subfolders; that is, add the files below this package.</li><li>● <a href="#">eaftAdjacentFilesAndSubFolders (3)</a>—Add adjacent files and files in subfolders; that is, add the files next to and below this package.</li></ul> |

### DeleteCondition Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteCondition method removes a detection or eligibility condition from a package in an Advanced UI or Suite/Advanced UI project.

## Syntax

DeleteCondition (pCondition As ISWiSuiteCondition)

## Parameters

**Table 70** - DeleteCondition Method Parameters

| Parameter  | Description                                                                                                                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pCondition | Specify the ISWiSuiteCondition object for the condition that you want to remove. The ISWiSuiteCondition object that you specify should be the condition object that is returned from the package's EligibleCondition property or its DetectionCondition property. |

## Applies To

- [ISWiSuitePackage](#)

## MoveDown Method (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** - The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

If your project has more than one package or transaction, the Packages view lists them in the same order in which the Advanced UI or Suite/Advanced UI installation launches them at run time. The MoveDown method moves a package or transaction down in the ordered list, below the item that follows it.

## Syntax

MoveDown ( )

## Parameters

The MoveDown method does not take any parameters.

## Applies To

- ISWiSuitePackage

## MoveUp Method (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

If your project has more than one package or transaction, the Packages view lists them in the same order in which the Advanced UI or Suite/Advanced UI installation launches them at run time. The MoveUp method moves a package or transaction up in the ordered list, above the item that precedes it.

## Syntax

MoveUp ( )

## Parameters

The MoveUp method does not take any parameters.

## Applies To

- ISWiSuitePackage

## ISWiSuiteRelease Object (Advanced UI and Suite/Advanced UI)

---

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

*Note that some edition- and project-specific differences are noted where applicable.*

The ISWiSuiteRelease object represents a release in the Releases view of InstallShield.

To add or remove releases, call ISWiProject.AddSuiteRelease or ISWiProject.DeleteSuiteRelease.

## Members

**Table 71** • ISWiSuiteRelease Object Members

| Name                        | Type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Build</b>                | Method                      | Build a release. Note that to get any feedback about the build process, you must subscribe to events on the release. To learn more, see <a href="#">Using Build Status Events</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>BuildLocation</b>        | Read-Write String Property  | Gets or sets the top-level directory where the release will be built.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>CachePackagesLocally</b> | Read-Write Boolean Property | <p>Gets or sets the Cache Packages Locally setting on the Setup.exe tab in the Releases view. This setting lets you specify whether you want to cache the Advanced UI or Suite/Advanced UI packages that are run on a target system in the location that is defined for each package in the Packages view. The default value is True.</p> <p>If you are building an uncompressed release, you may want to specify No for the value of this setting.</p>                                                                                                                                                                                                                                                                                |
| <b>CertPassword</b>         | Write-only String Property  | <p>Sets the password for the .pfx file if the file has a password. InstallShield encrypts the password and stores it in your project file (.ism).</p> <p>At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.</p>  <p><b>Note</b> • This property is not applicable if the certificate that you are using for signing is in a certificate store. Note that if the certificate was imported into the store with password protection, you will be prompted to enter the password at build time.</p> |
| <b>CheckPeriodicUpdates</b> | Read-Write Boolean Property | <p>Gets or sets the Check for App Updates Periodically setting under the App Updates Check area on the Updates tab of the Releases explorer on the Media view. This property lets you specify whether you want to configure additional settings to check the application updates periodically. Available options for this property are:</p> <ul style="list-style-type: none"> <li>• <b>True</b>—This property value enables the usage of UpdateFrequencyType property.</li> <li>• <b>False</b>— This property value disables the usage of UpdateFrequencyType property.</li> </ul>                                                                                                                                                    |

**Table 71** ▪ ISWiSuiteRelease Object Members (cont.)

| Name                         | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CryptographicProvider</b> | Read-Write<br>String<br>Property | <p>Gets or sets the Cryptographic Service Provider (CSP).</p>  <p><b>Note</b> ▪ <i>The Cryptographic Service Provider (CSP) name can be obtained from the Private Key Certificate properties of a user certificate in the EV Vendor Authentication Client tool.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>CustomSignArgs</b>        | Read-Write<br>String<br>Property | <p>Gets or sets the command-line argument for a sign tool's configuration to digitally sign build-generated files.</p> <p>For example, command-line argument below can be used if the Microsoft built-in signing tool is configured as a custom option to sign the binaries:</p> <pre>sign /fd SHA256 /f "&lt;ProgramFilesFolder&gt;\testCA.pfx" /t http://timestamp.digicert.com /p MyPassword [filename]</pre> <p>The [filename] variable is a place holder for full file path to be signed. It resolves to full path of the binary file to be signed during build time. By default, a file path will be added at the end of an argument and passed to a custom sign tool. Instead of using a hard-coded path, you can use the path variables or environment variables that are defined in your project.</p>  <p><b>Note</b> ▪ <i>You can use this property if the value of the <b>SigningType</b> property is <b>esesCustom (1)</b>.</i></p> |
| <b>CustomSignPath</b>        | Read-Write<br>String<br>Property | <p>Gets or sets the sign tool's location to digitally sign build-generated files by using that sign tool.</p>  <p><b>Note</b> ▪ <i>You can use this property if the value of the <b>SigningType</b> property is <b>esesCustom (1)</b>.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>DefaultLanguage</b>       | Read-Write<br>String<br>Property | <p>Gets or sets the language identifier for the default language of a given release. This property value overrides the default project language that is configured in the General Information view or the String Editor view.</p> <p>For more information, see <a href="#">Setting the Default Project Language</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 71** • ISWiSuiteRelease Object Members (cont.)

| Name                             | Type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DigitalCertificateInfo</b>    | Read-Write String Property  | <p>Gets or sets the digital certificate that you want to use to sign your release.</p> <p>To specify a .pfx certificate on your machine, specify the path and file name.</p> <p>To reference a certificate store that contains the certificate, use a string in the following format:</p> <p>*Store*StoreLocation:Cert Subject</p> <p><b>Store</b> refers to the name of the certificate store that contains the certificate. Available options are:</p> <ul style="list-style-type: none"> <li>• My</li> <li>• Root</li> <li>• Trust</li> <li>• CA</li> </ul> <p><b>StoreLocation</b> refers to the location of the certificate store that contains the certificate. Available options are:</p> <ul style="list-style-type: none"> <li>• User</li> <li>• Machine</li> </ul> <p><b>Cert Subject</b> refers to the subject of the certificate.</p> |
| <b>DigitalURL</b>                | Read-Write String Property  | <p>Gets or sets the URL that is used in your digital certificate to link to a location that you would like end users to visit to learn more about your product, organization, or company. Use a fully qualified URL—for example, <b>http://www.mydomain.com</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>EnableLangSelectionDialog</b> | Read-Write Boolean Property | <p>Gets or sets the Languages Dialog setting on the Build tab in the Releases view. This setting lets you specify whether you want your installation to display the language selection wizard page when the installation is run with a full user interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>EnableSuiteUpdates</b>        | Read-Write Boolean Property | <p>Gets or sets the Enable Updates setting under the General area on the Updates tab of the Releases explorer on the Media view. This property lets you specify whether you want downloadable update support for your Advanced UI or Suite/Advanced UI setup launcher. Available options for this property are:</p> <ul style="list-style-type: none"> <li>• <b>True</b>—This property value enables the downloadable updates.</li> <li>• <b>False</b>—This property value disables the downloadable updates.</li> </ul>                                                                                                                                                                                                                                                                                                                          |

**Table 71** ▪ ISWiSuiteRelease Object Members (cont.)

| Name                         | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>HourlyUpdateFrequency</b> | Read-Write<br>String<br>Property | Gets or sets the hourly time period on which you want the application updates to be checked. This property is used only if value of the UpdateFrequencyType property is Enumvalues(1). Use a string in the following format:<br><br>n hour(s)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>KeyContainerName</b>      | Read-Write<br>String<br>Property | Gets or sets the Private Key Container name associated to the Cryptographic Service Provider (CSP).<br><br><br><br><b>Note</b> ▪ The Container name can be obtained from the Private Key Certificate properties of a user certificate in the EV Vendor Authentication Client tool.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>LauncherPrivileges</b>    | Read-Write<br>String<br>Property | Gets or sets the Required Execution Level setting on the Setup.exe tab in the Releases view. This setting is where you specify the minimum level that is required by your project's Setup.exe file for running on Windows Vista and later platforms. The available options are: <ul style="list-style-type: none"> <li>• <b>erelAsAdmin (2)</b>—Setup.exe requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator.</li> <li>• <b>erelAsHighestAvail (1)</b>—Setup.exe prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges.</li> <li>• <b>erelAsInvoker (0)</b>—Setup.exe does not require administrative privileges, and all users can run it without administrative privileges. Setup.exe does not display any UAPrewC messages prompting for credentials or for consent. This is the default option for Advanced UI and Suite/Advanced UI projects.</li> </ul> <p>InstallShield embeds an application manifest in the Setup.exe launcher. This manifest specifies the selected execution level. Operating systems earlier than Windows Vista ignore the required execution level.</p> |
| <b>Name</b>                  | Read-Write<br>String<br>Property | Gets or sets the internal name for the release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Name                       | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PreProcessorDefines</b> | Read-Write<br>String<br>Property | <br><b>Project</b> ▪ This information applies to Suite/Advanced UI projects.<br><br>Gets or sets the preprocessor variable definitions. Preprocessor variable definitions that are specified here apply only to the current release; they are not used when compiling the script for other releases. Use the following format, with no spaces before or after equals signs or commas:<br><br>MYVARIABLE1=123,MYVARIABLE2<br><br>Such variables can be tested in the script by #if and #ifdef statements that control the flow of the script.<br><br>Entering the name of a preprocessor variable for this setting defines the variable. For example if you enter <b>MYVARIABLE</b> for this setting, the script commands in the following #ifdef loop are executed:<br><br><pre>#ifdef MYVARIABLE<br/>    // Commands<br/>#endif</pre><br>After you add or change a preprocessor variable definition for this setting, you must compile your installation for the addition or change to take effect. |
| <b>ProductNameOverride</b> | Read-Write<br>String<br>Property | Gets or overrides the product name that was specified in the General Information view with a new value for the selected release. For information on how the product name is used, see <a href="#">Specifying a Product Name</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 71** ▪ ISWiSuiteRelease Object Members (cont.)

| Name                          | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ProductVersionOverride</b> | Read-Write<br>String<br>Property | <p>Gets or overrides the product version that was specified in the General Information view with a new value for the selected release. The version must contain only numbers. The version number is typically in the format <i>aaa.bbb.ccccc</i> or <i>aaa.bbb.ccccc.ddddd</i>, where <i>aaa</i> represents the major version number, <i>bbb</i> represents the minor version number, <i>cccc</i> represents the build number, and <i>dddd</i> represents the revision number. The maximum value for the <i>aaa</i> and <i>bbb</i> portions is 255. The maximum value for <i>cccc</i> and <i>dddd</i> is 65,535.</p> <p>Note that although you can include the fourth field (<i>dddd</i>), the installation does not use this part of the product version to distinguish between different product versions. To learn more, see <a href="#">Specifying the Product Version</a>.</p> <p>The product version that you specify is displayed on the Properties dialog box for Setup.exe. For more information, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>                                                                                                            |
| <b>ReleaseFlags</b>           | Read-Write<br>String<br>Property | <p>Gets or sets a string that contains the release flags that you want to use to filter your features. Separate multiple flags with a comma.</p> <p>Release flags enable you to customize your installation by including or excluding certain items in each release.</p> <p>Once you have assigned release flags to features and packages in the Advanced UI or Suite/Advanced UI project, you can create a release that includes features and packages based on those flags. By default, all features and packages are included in a release. Once you specify a flag for the ReleaseFlags property (or for the Release Flags setting on the Build tab in the Releases view), only unflagged items and items that contain the specified release flag are included in your installation.</p> <div></div> <p><b>Note</b> ▪ If a release does not have release flags, it will include all applicable items that have release flags. To include only unflagged items, specify a flag that does not exist. For example, you might use <b>NoFlags</b>. This way, only unflagged items are built into a release.</p> |

**Table 71** • ISWiSuiteRelease Object Members (cont.)

| Name                       | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SetupExeCompany</b>     | Read-Write<br>String<br>Property | <p>Gets or sets the value to override the default company name for the Setup.exe. Note that you must also select a value of True for the UseMyVersionInfo property.</p> <p>The company name is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p> |
| <b>SetupExeCopyright</b>   | Read-Write<br>String<br>Property | <p>Gets or sets a custom copyright notice for the Setup.exe. Note that you must also select a value of True for the UseMyVersionInfo property.</p> <p>The copyright is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>                         |
| <b>SetupExeDescription</b> | Read-Write<br>String<br>Property | <p>Gets or sets a custom file description for Setup.exe. Note that you must also select a value of True for the UseMyVersionInfo property.</p> <p>The description is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>                           |

| Name                      | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SetupExeVersion</b>    | Read-Write<br>String<br>Property | <p>Gets or sets the value to override the default product version and file version for Setup.exe with your own version number. Note that you must also select a value of True for the UseMyVersionInfo property.</p> <p>The product version and file version are displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.</p> <p>Note that the file version always contains four fields. If you specify fewer than four fields for your product version, the remaining fields are filled with zeros. For example, if you specify a product version of <b>1.1</b>, the file version that is used in the version resources of Setup.exe is <b>1.1.0.0</b>.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p> |
| <b>SetupFileName</b>      | Read-Write<br>String<br>Property | <p>Gets or sets the file name—without the .exe file extension—that InstallShield should use for the setup launcher file that it generates at build time. If this setting is blank, InstallShield uses the default value of <i>Setup</i>, and the setup launcher file is called Setup.exe.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Build64bitSetupExe</b> | Read-Write<br>String<br>Property | <p>Gets or sets the value of the 64-Bit Setup Launcher setting for the current suite release. The possible values are:</p> <ul style="list-style-type: none"> <li>• TRUE - to 64-bit Setup Launcher.</li> <li>• FALSE - to 32-bit Setup Launcher.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>SetupIcon</b>          | Read-Write<br>String<br>Property | <p>Gets or sets the release's Setup.exe Icon File setting, which specifies the fully qualified name of the file from which the executable file's icon is taken at build time. If the property's value is null, a default icon is used.</p> <p>By default, the icon with index 0 is used; to specify a different icon, add a comma (,) as well as the icon's index or resource ID (preceded by a minus sign) after the file name. For example, <b>C:\Temp\MyLibrary.dll,2</b> indicates the icon with an index of 2, and <b>C:\Temp\MyLibrary.dll,-100</b> indicates the icon with a resource ID of 100.</p> <p>Instead of hard-coding a path, you can use a path variable that is defined in the Path Variables view or part of the ISWiPathVariables collection. At build time, InstallShield replaces the path variable with the appropriate value.</p>                  |

**Table 71** ▪ ISWiSuiteRelease Object Members (cont.)

| Name                        | Type                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SignatureDescription</b> | Read-Write<br>String<br>Property  | <p>Gets or sets the signature description for the Setup.exe file. The description that you specify is displayed on the User Account Control (UAC) box to the right of the “Program Name:” label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required.</p> <p>If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the “Program Name:” label on the UAC dialog box.</p>                                                                                                                                                                                                                                      |
| <b>SignEnabled</b>          | Read-Write<br>Boolean<br>Property | Gets or sets the Sign Setup.exe setting on the Signing tab in the Releases view. This setting lets you indicate whether you want to sign the Advanced UI or Suite/Advanced UI installation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SigningType</b>          | Read-Write<br>String<br>Property  | <p>Gets or sets the method to digitally sign build-generated files. Use the following options to set this property:</p> <ul style="list-style-type: none"> <li>● <b>esesBuiltin (0)</b>—Use this value to select the standard method in which the default InstallShield sign tool is used to digitally sign build-generated files.</li> <li>● <b>esesCustom (1)</b>—Use this value to select the custom method in which a customized sign tool is used to digitally sign build-generated files.</li> </ul> <p></p> <p><b>Note</b> ▪ By default, the value of the <b>SigningType</b> property is <b>esesBuiltin (0)</b> to select the standard method.</p> |
| <b>SuiteGuidOverride</b>    | Read-Write<br>String<br>Property  | Gets or overrides the GUID that uniquely identifies the Advanced UI or Suite/Advanced UI installation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>TokenPassword</b>        | Read-Write<br>String<br>Property  | <p>Gets or sets the EV token password which is encrypted and stored in a project file.</p> <p></p> <p><b>Note</b> ▪ Note the following information while specifying an EV token password:</p> <ul style="list-style-type: none"> <li>● An EV certificate vendor determines an EV token password's expiration period and number of the invalid password attempts before it is locked. Therefore, selecting this setting requires changing your password in specific intervals.</li> <li>● If an EV token password is locked, unlocking/resetting the token password requires an administrator password.</li> </ul>                                         |

**Table 71** ▪ ISWiSuiteRelease Object Members (cont.)

| Name                       | Type                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>UILanguages</b>         | Read-Write<br>String<br>Property  | Gets or sets a comma-delimited string of decimal language identifiers of the user interface languages that are included in a release.<br><br>Note that if a language is not selected in the Setup Languages setting in the General Information view of the project, it is not a valid language for the UILanguages property.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>UpdateDialogHeader</b>  | Read-Write<br>String<br>Property  | Gets or sets the title for the application's update dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>UpdateDialogText</b>    | Read-Write<br>String<br>Property  | Gets or sets the text for the application's update dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>UpdateFrequencyType</b> | Read-Write<br>Boolean<br>Property | Gets or sets the periodic interval that determines how often you want the Application updates to be checked. This property is used if the value of the CheckPeriodicUpdates property is True. Available options for this property are: <ul style="list-style-type: none"> <li>• <b>Enumvalues(0)</b>—This property value lets you to check the updates every day.</li> <li>• <b>Enumvalues(1)</b>—This property value lets you to check the updates on an hourly basis and enables to use the HourlyUpdateFrequency property.</li> <li>• <b>Enumvalues(2)</b>—This property value lets you to check the updates on an weekly basis and enables to use both the WeeklyUpdateFrequencyWeeks and WeeklyUpdateFrequencyDays properties.</li> </ul> |
| <b>UpdateUrl</b>           | Read-Write<br>String<br>Property  | If you may want to make updates for your Advanced UI or Suite/Advanced UI setup launcher available for download when they are available, use this property to specify the absolute path, including the file name, for an updated Advanced UI or Suite/Advanced UI setup launcher. This support makes it possible for end users to easily obtain a newer version of your product before installing an earlier version.<br><br>For more information about updates for your Advanced UI or Suite/Advanced UI installation, including requirements for the update, see <a href="#">Supporting Downloadable Updates for an Advanced UI or Suite/Advanced UI Installation</a> .                                                                      |

**Table 71** ▪ ISWiSuiteRelease Object Members (cont.)

| Name                             | Type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use64bitSigning</b>           | Read-Write String Property  | <p>Set this property to True if you want to use the 64-bit signing framework to digitally sign your package.</p> <p>Set this property to False if you want to use the 32-bit signing framework to digitally sign your package.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>UseMyVersionInfo</b>          | Read-Write Boolean Property | <p>Gets or sets the Use Custom Version Properties setting on the <b>Setup.exe</b> tab in the <b>Releases</b> view. This setting lets you specify whether you want to override the default copyright notice and file description for the Setup.exe with your own copyright notice and file description. If you specify a value of True, enter your own custom values for the SetupExeCopyright and SetupExeDescription properties.</p> <p>The copyright and file description are displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click the Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p> |
| <b>UsePathVariableTestValues</b> | Read-Write Boolean Property | <p>If you used test values for any of your path variables, set this property to True to set those variables to their actual values at this time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>VMConfig</b>                  | Read-Write String Property  | <div>  <p><b>Project</b> ▪ This is available in Suite/Advanced UI projects.</p> </div> <div>  <p><b>Edition</b> ▪ The Suite/Advanced UI project type is available in the Premier edition of InstallShield.</p> </div> <p>Gets or sets the name of the group of VM configuration settings that you want to use when distributing the selected release to a VM.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p>                                                   |

## Build Method (Advanced UI and Suite/Advanced UI)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

To build a release in an Advanced UI or Suite/Advanced UI project, call the Build method.

## Syntax

Build ()

## Build Status Events

The ISWiSuiteRelease object uses the following build status events:

- StatusMessage (string Message, ref bool Cancel)
- ProgressMax (int Max, ref bool Cancel)
- ProgressIncrement (int Increment, ref bool Cancel)
- TextCancel (ref bool Cancel)
- GetDotNetLibrary (out object ???)
- WarningMessage (string Message)
- ErrorMessage (string Message)
- IsCancelledByUserAnError (ref bool IsError)
- StatusMessageEx (string Message, object Tag, ref bool Cancel)

These events occur during the build process; they provide status updates. You can set pbCancel to stop the build.

# Automation Collections for Advanced UI and Suite/Advanced UI Projects

---

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

Each Advanced UI or Suite/Advanced UI automation collection is a set of objects. For example, the ISWiSuiteFeatures collection is a set of ISWiSuiteFeature objects in the current project. This section describes each of the Advanced UI or Suite/Advanced UI automation collections.

## ISWiLanguages Collection

**Edition** ▪ Support for multilanguage installations is available with InstallShield Premier Edition.

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiLanguages collection contains all of the languages in the current language.

### Members

**Table 72** ▪ ISWiLanguages Collection Members

| Name  | Type               | Description                                                                                     |
|-------|--------------------|-------------------------------------------------------------------------------------------------|
| Count | Read-Only Property | Use this property to return the total number of string entries in the ISWiLanguages collection. |
| Item  | Read-Only Property | Provide the index number or name of the language to retrieve the ISWiLanguage object.           |

## ISWiPathVariables Collection

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiPathVariables collection contains all of the Advanced UI or Suite/Advanced UI properties in the current project.

## Members

**Table 73** ▪ ISWiPathVariables Collection Members

| Name         | Type               | Description                                                                                         |
|--------------|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of path variables in the ISWiPathVariables collection. |
| <b>Item</b>  | Read-Only Property | Provide the index number or name of the path variable to retrieve the ISWiPathVariable object.      |

## Applies To

- *ISWiProject*

## ISWiProperties Collection

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiProperties collection contains all of the Advanced UI or Suite/Advanced UI properties in the current project.

## Members

**Table 74** • ISWiProperties Collection Members

| Name         | Type               | Description                                                                                      |
|--------------|--------------------|--------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of string entries in the ISWiProperties collection. |
| <b>Item</b>  | Read-Only Property | Provide the index number or name of the property to retrieve the ISWiProperty object.            |

## ISWiSetupFiles Collection

**Project** • This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

**Edition** • The *Advanced UI* project type is available in the Professional edition of InstallShield. The *Suite/Advanced UI* project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiSetupFiles collection contains all of the support files in the current project.

## Members

**Table 75** • ISWiSetupFiles Collection Members

| Name         | Type               | Description                                                                                      |
|--------------|--------------------|--------------------------------------------------------------------------------------------------|
| <b>Count</b> | Read-Only Property | Use this property to return the total number of string entries in the ISWiSetupFiles collection. |
| <b>Item</b>  | Read-Only Property | Provide the index number or name of the setup file to retrieve the ISWiSetupFiles object.        |

# ISWiSuiteActionRefs Collection

**Project** ▪ This information applies to the Suite/Advanced UI projects.

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

ISWiSuiteActionRefs is a collection that contains all of the Suite/Advanced UI actions that are scheduled for a specific event in a package.

# ISWiSuiteExitConditions Collection

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

ISWiSuiteExitConditions is a collection that contains all of the exit conditions in your project.

## Members

**Table 83** • ISWiSuiteExitConditions Collection Members

| Name  | Type               | Description                                                                                         |
|-------|--------------------|-----------------------------------------------------------------------------------------------------|
| Count | Read-Only Property | Use this property to return the total number of elements in the ISWiSuiteExitConditions collection. |
| Item  | Read-Only Property | Provide the index number of the exit condition to retrieve the ISWiSuiteExitCondition object.       |

## Applies To

- ISWiProject

## ISWiSuiteFeatures Collection

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

ISWiSuiteFeatures is a collection that contains every feature (as an ISWiSuiteFeature object) in your project.

When ISWiSuiteFeatures is a member of ISWiProject, it contains all of the root-level features in the project. To retrieve a collection of subfeatures, access the Features property of the ISWiSuiteFeature object. The result is an ISWiSuiteFeatures collection that contains the immediate subfeatures of the current root-level feature. Repeat for further levels of subfeatures.

## Members

# Object Reference for Expressions in Advanced UI and Suite/Advanced UI Projects

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

In various settings of Advanced UI and Suite/Advanced UI projects, you can embed object expressions to query target systems for information about a file, a registry entry, or other items. Object expressions use this convention:

```
[@Object(Parameters, ...).Property(Parameters, ...)]
```

Each object expression contains a reference to an object, which is a collection of object-specific properties. Objects and properties may contain parameters.

This section of the documentation explains each of the objects that are available for use in object expressions.

**Table 1** ▪ Objects That Are Available for Object Expressions

| Object                 | Description                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Feature Object</b>  | Check target systems for information about a feature in an Advanced UI or Suite/Advanced UI installation.  |
| <b>File Object</b>     | Check target systems for information about a file during an Advanced UI or Suite/Advanced UI installation. |
| <b>Parcel Object</b>   | Check target systems for information about a package in an Advanced UI or Suite/Advanced UI installation.  |
| <b>Platform Object</b> | Check target systems for operating system details during an Advanced UI or Suite/Advanced UI installation. |
| <b>Registry Object</b> | Check the registry on target systems during an Advanced UI or Suite/Advanced UI installation.              |

# Feature Object

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

To create an object expression that checks target systems for information about a feature in an Advanced UI or Suite/Advanced UI installation, use the Feature object. The Feature object has support for properties such as DisplayName, ActionState, and InstalledState.

## Syntax

```
[@Feature(FeatureName).ActionState]
[@Feature(FeatureName).AllowSelectionChange]
[@Feature(FeatureName).Cost]
[@Feature(FeatureName).Description]
[@Feature(FeatureName).DisplayName]
[@Feature(FeatureName).InstalledState]
[@Feature(FeatureName).Visible]
```

## Parameters

One parameter is available for the Feature object.

**Table 2** ▪ Parameters for the Feature Object

| Parameter   | Description                      |
|-------------|----------------------------------|
| FeatureName | Specify the name of the feature. |

## Properties

The following properties are available for the Feature object.

**Table 3** ▪ Properties for the Feature Object

| Property    | Description                                                                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ActionState | Retrieves the currently set action state of the feature. Valid values are: <ul style="list-style-type: none"><li>• 0—No action will be taken for the feature.</li><li>• 1—The feature will be installed.</li><li>• 2—The feature will be removed.</li></ul> |

**Table 3** • Properties for the Feature Object (cont.)

| Property                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AllowSelectionChange</b> | Retrieves a Boolean value that indicates whether end users should be allowed to select or deselect the feature on the InstallationFeatures wizard page. Valid values are: <ul style="list-style-type: none"> <li><b>true</b>—End users should be able to select or deselect the feature through the wizard interface. This is the default option.</li> <li><b>false</b>—End users should not be able to select or deselect the feature through the wizard interface. If this feature is visible on the InstallationFeatures wizard page, it appears in a read-only state (either selected or deselected, based on other factors, such as the feature's condition).</li> </ul> |
| <b>Cost</b>                 | Retrieves how much space (in bytes) the feature requires on the target system if this value was specified in the Features view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>          | Retrieves the localized description of the feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DisplayName</b>          | Retrieves the localized display name of the feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>InstalledState</b>       | Retrieves the installed state of the feature as determined by the package detection states of the packages in the feature. Valid values are: <ul style="list-style-type: none"> <li><b>0</b>—The feature is not currently installed.</li> <li><b>3</b>—The feature is installed.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Visible</b>              | Retrieves a Boolean value that indicates whether the feature should be visible on the InstallationFeatures wizard page during installation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Examples

The following examples demonstrate use of the Feature object in object expressions.

**Table 4** • Sample Feature Object Expressions

| Expression                                | Description                                                                                  |
|-------------------------------------------|----------------------------------------------------------------------------------------------|
| <b>[@Feature(FeatureABC).ActionState]</b> | Determine whether the Advanced UI or Suite/Advanced UI is installing the FeatureABC feature. |
| <b>[@Feature(FeatureABC).Cost]</b>        | Determine how much space (in bytes) the feature requires.                                    |

# File Object

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

To create an object expression that checks target systems for information about a file during an Advanced UI or Suite/Advanced UI installation, use the File object. The File object has support for properties such as Date and Version.

## Syntax

```
[@File(FilePath,64Bit).Content]
```

```
[@File(FilePath,64Bit).Date(Parameter)]
```

```
[@File(FilePath,64Bit).Version]
```

## Parameters

The following parameters are available for the File object.

**Table 5** ▪ Parameters for the File Object

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FilePath</b> | Specify the path to the file. You can use property directory identifiers such as [ProgramFilesFolder].                                                                                                                                                                                                                                                                                                                                                          |
| <b>64Bit</b>    | <p>Use this optional Boolean parameter to indicate whether the file is in a 64-bit location, such as in the System32 folder on a 64-bit system. Valid options are:</p> <ul style="list-style-type: none"> <li>• <b>true</b>—Check the 64-bit location.</li> <li>• <b>false</b>—Check the 32-bit location.</li> </ul> <p>If you omit this property, or if the target system is running a 32-version of Windows, the installation checks the 32-bit location.</p> |

## Properties

The following properties are available for the File object.

**Table 6** ▪ Properties for the File Object

| Property       | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Content</b> | If the file is a text file (for example, .txt, .htm, .xml, .config, .ini, or .sql), retrieves the contents of the file. |

**Table 6** • Properties for the File Object (cont.)

| Property       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Date</b>    | <p>Retrieves the date and time for the file. Optional parameters that are available for this property are:</p> <ul style="list-style-type: none"> <li>● <b>modified</b>—Retrieves the date and time at which the file was last modified. This is the default parameter.</li> <li>● <b>access</b>—Retrieves the date and time at which the file was last accessed.</li> <li>● <b>create</b>—Retrieves the date and time at which the file was created.</li> </ul> <p>If you omit a parameter for the Date property, the File object returns the last-modified date.</p> |
| <b>Version</b> | Retrieves the version of the file. For an unversioned file, this property returns empty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Examples

The following examples demonstrate use of the File object in object expressions

**Table 7** • Sample File Object Expressions

| Expression                                                                       | Description                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>[@File([ProgramFilesFolder]MyCompany\MyProduct.exe,false).Date(modified)]</b> | <p>Obtain the last modified date and time for a file called MyProduct.exe.</p> <p>On 32-bit target systems, the path may be this:<br/>C:\Program Files\MyCompany\MyProduct.exe</p> <p>On 64-bit target systems, the path may be this:<br/>C:\Program Files (x86)\MyCompany\MyProduct.exe</p> |
| <b>[@File([SystemFolder]notepad.exe).Version]</b>                                | Obtain the version number of notepad.exe in the System32 folder on 32-bit target systems or in the SysWOW64 folder on 64-bit target systems.                                                                                                                                                 |
| <b>[@File([SystemFolder]notepad.exe,true).Version]</b>                           | Obtain the version number of notepad.exe in the System32 folder on 32-bit and 64-bit target systems.                                                                                                                                                                                         |

## Parcel Object

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

To create an object expression that checks target systems for information about a package in an Advanced UI or Suite/Advanced UI installation, use the Parcel object. The Parcel object has support for properties such as Eligible, ActionState, and DetectedState.

Syntax

```
[@Parcel(PackageGUID).ActionState]
[@Parcel(PackageGUID).DetectedState]
[@Parcel(PackageGUID).Eligible]
[@Parcel(PackageGUID).ExitCode]
[@Parcel(PackageGUID).Type]
```

Parameters

One parameter is available for the Parcel object.

Table 8 • Parameters for the Parcel Object

| Parameter   | Description                      |
|-------------|----------------------------------|
| PackageGUID | Specify the GUID of the package. |

Properties

The following properties are available for the Parcel object.

Table 9 • Properties for the Parcel Object

| Property      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ActionState   | Retrieves the currently set action state of the package. This value may change, depending on when at run time the property is queried. Valid values are: <ul style="list-style-type: none"><li>1—The package will run its install operation.</li><li>2—The package will run its modify operation.</li><li>3—The package will run its repair operation.</li><li>4—The package will run its remove operation.</li><li>5—No action will be performed for the package.</li></ul> |
| DetectedState | Retrieves the installed state of the package. Valid values are: <ul style="list-style-type: none"><li>0—The package is not installed.</li><li>1—The package is currently installed.</li></ul>                                                                                                                                                                                                                                                                                |
| Eligible      | Retrieves a Boolean value that indicates whether the target system meets the requirements that are necessary for the package to be run.                                                                                                                                                                                                                                                                                                                                      |

**Table 9** ▪ Properties for the Parcel Object (cont.)

| Property        | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ExitCode</b> | Retrieves the exit code for the package once its scheduled operation has completed. The value of this property is indeterminate before package operations are run.                                                                                                                                                                                                                              |
| <b>Name</b>     | Retrieves the display name of the package.                                                                                                                                                                                                                                                                                                                                                      |
| <b>Type</b>     | Retrieves the type of package. Valid values are: <ul style="list-style-type: none"> <li>● <b>0</b>—Executable package (.exe)</li> <li>● <b>1</b>—Windows Installer package (.msi)</li> <li>● <b>2</b>—Patch package (.msp)</li> <li>● <b>3</b>—InstallScript package (.hdr)</li> <li>● <b>5</b>—Sideloaded Windows App package (.appx)</li> <li>● <b>6</b>—Web Deploy package (.zip)</li> </ul> |

## Examples

The following examples demonstrate use of the Parcel object in object expressions.

**Table 10** ▪ Sample Parcel Object Expressions

| Expression                                                           | Description                                                                      |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <b>[@Parcel(0F283EC0-E9D1-4D18-801D-0014F6CA96DF).DetectedState]</b> | Determine whether the referenced package is installed.                           |
| <b>[@Parcel(0F283EC0-E9D1-4D18-801D-0014F6CA96DF).ExitCode]</b>      | Obtain the exit code for the package once its scheduled operation has completed. |

# Platform Object

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

To create an object expression that checks target systems for operating system details during an Advanced UI or Suite/Advanced UI installation, use the Platform object. The Platform object has support for properties such as Architecture, FullVersion, and MajorVersion.

## Syntax

[@Platform.Architecture]

[@Platform.BuildNumber]

[@Platform.CSDVersion]

[@Platform.FullVersion]

[@Platform.MajorVersion]

[@Platform.MinorVersion]

[@Platform.ProductType]

[@Platform.ServicePackVersion]

[@Platform.Value]

## Parameters

The Platform object does not have any parameters.

## Properties

The following properties are available for the Platform object.

**Table 11** ▪ Properties for the Parcel Object

| Property            | Description                                                                                                                                                                                                                                                                                                                |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Architecture</b> | Retrieves the architecture (x86, x64, IA64, ARM, or Unknown) of the machine on which the Advanced UI or Suite/Advanced UI installation is running.                                                                                                                                                                         |
| <b>BuildNumber</b>  | Retrieves the build number version of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running.<br><br>For a list of valid build numbers, see the dwBuildNumber member of the OSVERSIONINFOEX structure that is documented in the MSDN Library.                                        |
| <b>CSDVersion</b>   | Retrieves the CSD version of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running. Service Pack 2 is an example of a CSD version.                                                                                                                                                  |
| <b>FullVersion</b>  | Retrieves the full version number of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running. The value is calculated as MajorVersion X 100 + MinorVersion.<br><br>For example, the version number of Windows 8.1 is 6.3. The FullVersion value on a machine with Windows 8.1 is 603. |
| <b>MajorVersion</b> | Retrieves the major version number of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running.                                                                                                                                                                                        |
| <b>MinorVersion</b> | Retrieves the minor version number of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running.                                                                                                                                                                                        |

**Table 11** ▪ Properties for the Parcel Object (cont.)

| Property                  | Description                                                                                                                                                                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ProductType</b>        | Retrieves the product type of the machine on which the Advanced UI or Suite/Advanced UI installation is running. Valid values are: <ul style="list-style-type: none"> <li>● <b>1</b>—Workstation</li> <li>● <b>2</b>—Domain controller</li> <li>● <b>3</b>—Server</li> </ul> |
| <b>ServicePackVersion</b> | Retrieves the service pack version of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running.                                                                                                                                          |
| <b>Value</b>              | Retrieves the same value as the FullVersion property.                                                                                                                                                                                                                        |

## Examples

The following examples demonstrate use of the Platform object in object expressions.

**Table 12** ▪ Sample Platform Object Expressions

| Expression                      | Description                                     |
|---------------------------------|-------------------------------------------------|
| <b>[@Platform.FullVersion]</b>  | Obtain the version number of the target system. |
| <b>[@Platform.Architecture]</b> | Obtain the architecture of the target system.   |

# Registry Object

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

To create an object expression that checks the registry on target systems during an Advanced UI or Suite/Advanced UI installation, use the Registry object.

## Syntax

```
[@Registry(RegistryKeyPath,64Bit).KeyValue(DataValueName)]
```

```
[@Registry(RegistryKeyPath,64Bit).Value]
```

## Parameters

The following parameters are available for the Registry object.

**Table 13** ▪ Parameters for the Registry Object

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RegistryKeyPath</b> | <p>Specify the full path of the registry key that you want to check on target systems. Use the following abbreviations for the root:</p> <ul style="list-style-type: none"><li>• HKCR</li><li>• HKCU</li><li>• HKLM</li></ul>                                                                                                                                                                                                                         |
| <b>64Bit</b>           | <p>Use this optional Boolean parameter to indicate whether to check the 64-bit view of the registry. Valid options are:</p> <ul style="list-style-type: none"><li>• <b>true</b>—Check the 64-bit view of the registry.</li><li>• <b>false</b>—Check the 32-bit view of the registry.</li></ul> <p>If you omit this property, or if the target system is running a 32-version of Windows, the installation checks the 32-bit view of the registry.</p> |

## Properties

The following properties are available for the Registry object.

**Table 14** ▪ Properties for the Registry Object

| Property        | Description                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------|
| <b>KeyValue</b> | Retrieve the value data of the value that is passed as a parameter for the KeyValue property. |
| <b>Value</b>    | Retrieve the value data of the registry key's default value.                                  |

## Examples

The following examples demonstrate use of the Registry object in object expressions.

**Table 15** ▪ Sample Registry Object Expressions

| Expression                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>[@Registry(HKLM\Software\Microsoft\Windows NT\CurrentVersion, false).KeyValue(RegisteredOwner)]</b> | <p>On 32-bit target systems, obtain the value data of the RegisteredOwner value for the following registry key:</p> <p>HKLM\Software\Microsoft\Windows NT\CurrentVersion</p> <p>On 64-bit target systems, obtain the value data of the RegisteredOwner value for the following registry key:</p> <p>HKLM\Software\Wow6432Node\Microsoft\Windows NT\CurrentVersion</p>                                                                                                                                                           |
| <b>[@Registry(HKLM\Software\[COMPANY]\[PRODUCT], true).Value]</b>                                      | <p>On 32-bit and 64-bit target systems, obtain the value data of the default value for the following registry key:</p> <p>HKLM\Software\My Company Name\My Product Name</p>                                                                                                                                                                                                                                                                                                                                                     |
| <b>[@Registry(HKCR\Software\My Company Name\My Product Name, false).KeyValue(MyFile[\[]1[\]].exe)]</b> | <p>On 32-bit target systems, obtain the value data of the MyFile[1].exe value for the following registry key:</p> <p>HKCU\Software\My Company Name\My Product Name</p> <p>On 64-bit target systems, obtain the value data of the MyFile[1].exe value for the following registry key:</p> <p>HKLM\Software\Wow6432Node\My Company Name\My Product Name</p> <p>To avoid treating the square brackets in the data value name as parameter parse indicators, the square brackets are escaped as shown in the sample expression.</p> |

# InstallShield Custom Action Reference

This section describes each of the built-in InstallShield custom actions that are added automatically to InstallShield projects to support different functionality.

---

**Windows Logo** - If you are applying for the Windows logo, the intended behavior of each custom action in your installation must be documented. This does not apply to custom action types 19 (displays an error, returns failure, and ends the installation), 35 (sets the installation directory), or 51 (sets a property). **ISICE10** validates that each custom action is documented.

## **\_serial\_verifyCA\_isx**

Decreases the value of the property SERIALNUMVALRETRYLIMIT by 1.

## **\_serial\_verifyCA\_isx\_helper**

Decreases the value of the property SERIALNUMVALRETRYLIMIT by 1.

## **CheckForProductUpdates**

Uses FlexNet Connect to check for product updates.

This custom action launches an executable file called `Agent.exe`, and it passes the following:

```
/au[ProductCode] /EndOfInstall
```

## **CheckForProductUpdatesOnReboot**

Uses FlexNet Connect to check for product updates on reboot.

This custom action launches an executable file called `Agent.exe`, and it passes the following:

```
/au[ProductCode] /EndOfInstall /Reboot
```

## **DLLWrapCleanup**

Standard DLL wrapper that cleans extracted data.

This is a Windows Installer DLL custom action. The name of the DLL file is `dllwrap.dll`, and its entry point is `DLLWrapCleanup`.

## **DLLWrapStartup**

Standard DLL wrapper that extracts data that describes calls.

This is a DLL custom action. The name of the DLL file is `dllwrap.dll`, and its entry point is `DLLWrapStartup`.

## **ISChainPackageCommit**

Removes extracted files from a multi-package transaction.

## ISChainPackagePrepare

Prepares and extracts files for a multi-package transaction.

## ISChainPackageRollback

Removes extracted files from a multi-package transaction.

## ISComponentServiceCosting

Extracts information from the ISComPlusApplication table and saves it in a temporary file for COM+ applications.

This is a Windows Installer DLL custom action. The name of the DLL file is `iscomsrv.dll`, and its entry point is `ISComponentServiceCosting`.

## ISComponentServiceFinalize

Commits COM+ applications during installation and uninstallation.

This is a Windows Installer DLL custom action. The name of the DLL file is `iscomsrv.dll`, and its entry point is `ISComponentServiceFinalize`.

## ISComponentServiceInstall

Installs COM+ applications during an installation.

This is a DLL custom action. The name of the DLL file is `iscomsrv.dll`, and its entry point is `ISComponentServiceInstall`.

## ISComponentServiceRollback

Rolls back COM+ applications during a failed installation or uninstallation.

This is a DLL custom action. The name of the DLL file is `iscomsrv.dll`, and its entry point is `ISComponentServiceRollback`.

## ISComponentServiceUninstall

Removes COM+ applications during uninstallation.

This is a DLL custom action. The name of the DLL file is `iscomsrv.dll`, and its entry point is `ISComponentServiceUninstall`.

## ISIISCleanup

Removes temporary files and registry entries for an IIS installation.

This is a DLL custom action. The name of the DLL file is `IISHelper.dll`, and its entry point is `ISIISCleanup`.

## ISIISCosting

Creates a list of actions in a temporary file for an IIS installation. Sets the `CustomActionData` property for other IIS actions.

This is a DLL custom action. The name of the DLL file is `IISHelper.dll`, and its entry point is `ISIISCosting`.

## ISIIInstall

Creates Web sites, applications, virtual directories, and other items for an IIS installation.

This is a DLL custom action. The name of the DLL file is `IISHelper.dll`, and its entry point is `ISIIInstall`.

## ISIISRollback

Removes Web sites, applications, virtual directories, and other items during rollback for IIS.

This is a DLL custom action. The name of the DLL file is `IISHelper.dll` and its entry point is `ISIISRollback`.

## ISIISUninstall

Removes Web sites, applications, virtual directories, and other items during uninstallation for IIS.

This is a DLL custom action. The name of the DLL file is `IISHelper.dll`, and its entry point is `ISIISUninstall`.

## ISInstallPrerequisites

Launches the installation of prerequisites that are associated with features.

This is a DLL custom action. The name of the DLL file is `PrqLaunch.dll`, and its entry point is `InstallPrerequisites`.

## ISJITCompileActionAtInstall

Precompiles .NET assemblies at installation time.

This custom action launches a Microsoft executable file called `ngen.exe`.

## ISJITCompileActionAtUnInstall

Deletes a precompiled .NET assemblies at uninstallation time.

This custom action launches a Microsoft executable file called `ngen.exe`.

## ISLockPermissionsCost

Sets the `CustomActionData` property for the `ISLockPermissionsInstall` action.

This is a DLL custom action. The name of the DLL file is `ISLockPermissions.dll`, and its entry point is `ISLockPermissionsCostAction`.

## ISLockPermissionsInstall

Sets permissions when the product is installed.

This is a DLL custom action. The name of the DLL file is `ISLockPermissions.dll`, and its entry point is `ISLockPermissionsInstallAction`.

## ISNetApiInstall

Creates users and groups from an .ini file.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetAPI.dll`, and its entry point is `ISNetApiInstall`.

## ISNetApiRollback

Rolls back changes for users and groups.

This is a DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetApiRollback.

## ISNetCreateIniForOneUser

Extracts operations to a temporary file for users and groups.

This is a DLL custom action called ISNetAPI.dll.

## ISNetDeleteIniFile

Cleans up temporary files for users and groups.

This is a DLL custom action called ISNetAPI.dll.

## ISNetGetGroups

Puts groups into a combo box.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetGetGroups.

## ISNetGetServers

Puts a list of servers into a combo box.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetGetServers.

## ISNetGetUsers

Puts a list of users into a combo box.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetGetUsers.

## ISNetSetLogonName

Stores the user, group, and server properties that were entered in the LogonInformation dialogs.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetSetLogonName.

## ISNetValidateLogonName

Verifies that a valid user name, server, and password combination were entered in the LogonInformation dialogs.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetValidateLogonName.

## ISNetValidateNewUserInfo

Stores the user, group, and server properties that were entered in the LogonInformation dialogs.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetAPI.dll`, and its entry point is `ISNetValidateNewUserInfo`.

### **ISNetworkSharesCosting**

Extracts information from the `ISNetworkShares` table and saves it in a temporary file for network sharing.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetworkShares.dll`, and its entry point is `ISNetworkSharesCosting`.

### **ISNetworkSharesFinalize**

Cleans up temporary files for configuring network shares.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetworkShares.dll`, and its entry point is `ISNetworkSharesFinalize`.

### **ISNetworkSharesInstall**

Configures network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetworkShares.dll`, and its entry point is `ISNetworkSharesInstall`.

### **ISNetworkSharesRollback**

Rolls back network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetworkShares.dll`, and its entry point is `ISNetworkSharesRollback`.

### **ISNetworkSharesUninstall**

Removes network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISNetworkShares.dll`, and its entry point is `ISNetworkSharesUninstall`.

### **ISPrint**

Prints the contents of a `ScrollableText` control on a dialog.

This is a Windows Installer DLL custom action. The name of the DLL file is `SetAllUsers.dll`, and its entry point is `PrintScrollableText`.

### **ISQuickPatchFinalize**

Cleans shared reference counts for a `QuickPatch`.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is `ISQuickPatchFinalize`.

### **ISQuickPatchFixShortcut**

Reinstalls shortcuts for a `QuickPatch`.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is `ISQuickPatchFixShortcut`.

### **ISQuickPatchHelper**

Applies clean feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is `ISQuickPatchHelper`.

### **ISQuickPatchInit**

Cleans component and feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is `ISQuickPatchInit`.

### **ISQuickPatchInit9X**

Cleans component and feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is `ISQuickPatchInit9X`.

### **ISQuickPatchInit9X2**

Cleans component and feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is `QuickPatchHelper.dll`, and its entry point is `ISQuickPatchInit9X2`.

### **ISRunSetupTypeAddLocalEvent**

Runs the `AddLocal` events that are associated with the Next button on the `SetupType` dialog. This action needs to be called when the installation does not display the `SetupType` dialog.

This is a Windows Installer DLL custom action. The name of the DLL file is `ISXExpHlp.dll`, and its entry point is `RunSetupTypeAddLocalEvent`.

### **ISSearchReplaceCosting**

Creates a temporary file that has a list of changes that need to be made in text files.

This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is `ISSearchReplaceCosting`.

### **ISSearchReplaceFinalize**

Cleans up temporary files for text file changes.

This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is `ISSearchReplaceFinalize`.

## ISSearchReplaceInstall

Applies text file changes when the product is installed.

This is a DLL custom action. The name of the DLL file is `isschrp1.dll`, and its entry point is `ISSearchReplaceInstall`.

## ISSearchReplaceRollback

Rolls back text file changes and cleans up temporary files for text file changes.

This is a DLL custom action. The name of the DLL file is `isschrp1.dll`, and its entry point is `ISSearchReplaceRollback`.

## ISSearchReplaceUninstall

Applies text file changes when the product is uninstalled.

This is a DLL custom action. The name of the DLL file is `isschrp1.dll`, and its entry point is `ISSearchReplaceUninstall`.

## ISSelfRegisterCosting

Extracts operations to a temporary file for self-registration.

This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is `ISSelfRegisterCosting`.

## ISSelfRegisterFiles

Registers self-registering files.

This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is `ISSelfRegisterFiles`.

## ISSelfRegisterFinalize

Cleans up temporary file from self-registration.

This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is `ISSelfRegisterFinalize`.

## ISSetAllUsers

Sets `ALLUSERS` per upgrade or initial installation requirements.

This is a DLL custom action. The name of the DLL file is `SetAllUsers.dll`, and its entry point is `SetAllUsers`.

## ISSetTARGETDIR

Sets `TARGETDIR` to `[INSTALLDIR]`.

This is a DLL custom action. The name of the DLL file is `SetAllUsers.dll`, and its entry point is `SetTARGETDIR`.

## ISSetupFilesCleanup

Cleans up the temp directory of support files.

This is a DLL custom action. The name of the DLL file is SFHelper.dll, and its entry point is SFCleanupEx.

## ISSetupFilesExtract

Extracts support files to a temp directory.

This is a DLL custom action. The name of the DLL file is SFHelper.dll, and its entry point is SFStartupEx.

## ISSQLQueryDatabases

Finds database catalogs that are available on a specified database server.

This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLQueryDatabases.

## ISSQLServerCosting

Extracts operations to a temporary file for SQL scripts.

This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerCosting.

## ISSQLServerFilteredList

Finds available servers for SQL scripts.

This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerFilteredList.

## ISSQLServerFinalize

Cleans up temporary files and the state for SQL scripts.

This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerFinalize.

## ISSQLServerInitialize

Adds property names for SQL login password to MsiHiddenProperties.

This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerInitialize.

## ISSQLServerInstall

Runs SQL scripts during an installation.

This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerInstall.

## ISSQLServerList

Finds available servers.

This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerList.

## ISSQLServerRemoveLoginInfo

Removes SQL database login credentials from the Windows registry during an uninstallation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerRemoveLoginInfo`.

## ISSQLServerRollback

Runs SQL scripts during a failed installation or uninstallation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerRollback`.

## ISSQLServerRollbackLoginInfo

During a failed installation or uninstallation, rolls back SQL database login credentials that are stored in the Windows registry.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerRollbackLoginInfo`.

## ISSQLServerUninstall

Runs SQL scripts during an uninstallation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerUninstall`.

## ISSQLServerValidate

Tests server connections.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerValidate`.

## ISSQLServerWriteLoginInfo

Writes SQL database login credentials to the Windows registry during an installation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerWriteLoginInfo`.

## ISUnSelfRegisterFiles

Unregisters self-registering files.

This is a DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is `ISUnSelfRegisterFiles`.

## ISVerifyScriptingRuntime

Verifies that an InstallScript MSI installation was launched using `Setup.exe`, and if not, it displays the message contained in the property `STANDARD_USE_SETUPEXE`. This custom action is included in all InstallScript MSI projects, and it is scheduled for the beginning of the User Interface sequence.

**Note** ▪ The *ISVerifyScriptingRuntime* custom action is called in an *InstallScript MSI* installation in which the *InstallScript UI* style is the traditional style (which uses the *InstallScript* engine as an external UI handler). It is not called for the new style (which uses the *InstallScript* engine as an embedded UI handler).

To learn more, see [Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations](#).

## ISXmlAppSearch

Performs a system search for XML: finds file, performs XPath queries, and stores the results in properties. Driven by the *ISXmlLocator* table.

This is a DLL custom action. The name of the DLL file is *isxmlcfg.dll*, and its entry point is *ISXmlAppSearch*.

## ISXmlCosting

Extracts operations to a temporary file for XML file changes.

This is a DLL custom action. The name of the DLL file is *isxmlcfg.dll*, and its entry point is *ISXmlCosting*.

## ISXmlFinalize

Cleans up temporary files for XML file changes.

This is a DLL custom action. The name of the DLL file is *isxmlcfg.dll*, and its entry point is *ISXmlFinalize*.

## ISXmlInstall

Applies XML file changes.

This is a DLL custom action. The name of the DLL file is *isxmlcfg.dll*, and its entry point is *ISXmlInstall*.

## ISXmlRollback

Rolls back XML file changes.

This is a DLL custom action. The name of the DLL file is *isxmlcfg.dll*, and its entry point is *ISXmlRollback*.

## ISXmlUnInstall

Uninstalls XML file changes.

This is a DLL custom action. The name of the DLL file is *isxmlcfg.dll*, and its entry point is *ISXmlUnInstall*.

## LaunchProgramFileFromSetupCompleteSuccess

Launches an executable file at the end of an installation.

This is a Windows Installer DLL custom action. The name of the DLL file is *SerialNumCAHelper.dll*, and its entry point is *LaunchProgram*.

## LaunchReadmeFileFromSetupCompleteSuccess

Launches a readme file at the end of an installation.

This is a Windows Installer DLL custom action. The name of the DLL file is `SerialNumCAHelper.dll`, and its entry point is `LaunchReadMe`.

### setAllUsersProfile2K

Initializes the `ALLUSERSPROFILE` directory identifier for Windows 2000 or later.

### SetAllUsersProfileNT

Initializes the `ALLUSERSPROFILE` directory identifier for Windows NT 4.

### SetARPINSTALLLOCATION

Sets the value of the `ARPINSTALLLOCATION` property to the fully qualified path for the application's primary folder.

### setUserProfileNT

Initializes the `USERPROFILE` directory identifier.

### ShowMsiLog

Displays the Windows Installer log file in Notepad if the end user selects the **Show the Windows Installer log** check box in the `SetupCompleteSuccess`, `SetupCompleteError`, or `SetupInterrupted` dialogs and then clicks Finish. This works only with Windows Installer 4.0 and later.

### WiseScriptFinalize

Cleans up temporary files for a WiseScript custom action.

This is a DLL custom action. The name of the DLL file is `WiseScriptBridge.dll`, and its entry point is `WiseScriptFinalize`.

### WiseScriptInitialize

Extracts required files for a WiseScript custom action.

This is a DLL custom action. The name of the DLL file is `WiseScriptBridge.dll`, and its entry point is `WiseScriptInitialize`.

### WiseScriptRollback

Cleans up temporary files for a WiseScript custom action.

This is a DLL custom action. The name of the DLL file is `WiseScriptBridge.dll`, and its entry point is `WiseScriptFinalize`.

# Command-Line Tools

In addition to its graphical user interface, InstallShield provides several command-line programs that you can use during build time, for instance, as part of a batch process, or during run time to customize the behavior of your installation.

## Authoring-Time Programs

**Table 1** • Descriptions of Authoring-Time Programs

| Task                                                                                                   | Program     |
|--------------------------------------------------------------------------------------------------------|-------------|
| Scan an IIS Web site and record its settings so that you can import them into an InstallShield project | iisscan.exe |

## Build-Time Programs

**Table 2** • Descriptions of Build-Time Programs

| Task                                                                                        | Program             |
|---------------------------------------------------------------------------------------------|---------------------|
| Compile an InstallScript file (.rul)                                                        | Compile.exe         |
| Build a release; if applicable, also compile the InstallScript                              | ISCmdBld.exe        |
| Build a release (available for legacy InstallScript projects)                               | ISBuild.exe         |
| Sign an already-built InstallScript release                                                 | iSign.exe           |
| Build a release (InstallScript self-extracting executable files)                            | ReleasePackager.exe |
| Modify a Setup.ini file that is embedded in a Basic MSI or InstallScript MSI Setup.exe file | SetupIni.exe        |

## Run-Time Programs

**Table 3** • Descriptions of Run-Time Programs

| Task                                                                                                                     | Program                            |
|--------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| Run a Setup.exe installation and pass command-line parameters (Basic MSI, InstallScript, and InstallScript MSI projects) | Setup.exe                          |
| Run a Setup.exe installation and pass command-line parameters (Advanced UI and Suite/Advanced UI projects)               | Setup.exe                          |
| Run an installation (InstallScript projects)                                                                             | Setup.exe (InstallScript projects) |
| Run an .msi package                                                                                                      | MsiExec.exe                        |
| Run a patch package (Windows Installer-based projects) and pass command-line parameters                                  | Update.exe                         |

# Compile.exe

InstallShield includes a command-line compiler that you can invoke from the Command Prompt window or from a DOS batch file. This program, called `Compile.exe`, is in the following folder:

*InstallShield Program Files Folder/System*

---

**Note** ▪ When you build a release from the command line using `ISCmdBld.exe`, the build engine automatically compiles your script; therefore, you do not need to use `Compile.exe` directly unless you want to use compiler options that are different from those specified for the project in InstallShield. For more information, see [ISCmdBld.exe](#).

## Syntax

`Compile script_file [iswi_obl_file] [isrt_obl_file] [ifx_obl_file] switches`

You can pass any or all of your command-line parameters to `Compile.exe` in the form of a command file. To specify a command file to `Compile.exe`, use the following syntax:

`Compile @command_file`

In this example, *command\_file* is the name of a text file, including any extension. You can specify an absolute or relative path with the file name.

You can specify all or part of the command line in a command file. You can use more than one command file in a `Compile` command. `Compile.exe` accepts the command file's input as if it were specified in that location on the command line.

In the command file, each parameter must begin and end on the same line—you cannot use the backslash (\) to combine a parameter across two lines. In the command file, arguments can be separated by spaces or tabs (as on the command line) and by newline (\n) characters.

Parameters

The following parameters are available for use with the compiler.

Table 4 • Command-Line Parameters for Compile.exe

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| script_file   | <p>Specifies the name of the setup script. Note the following:</p> <ul style="list-style-type: none"><li>• The file name can include a drive designation and an absolute or relative path. If the file name is unqualified, the compiler will search for the script in the current directory of the current drive.</li><li>• If the specified setup script uses #include directives to include other files in the setup, and if the file names specified by #include statements do not include a path, you must specify the location of those files with the -i switch unless they reside in the current directory. Note that included files may themselves specify #include directives; be sure the -i switch specifies a search path that can be used to find all included source files.</li><li>• Long path and file names must be enclosed in double quotation marks.</li><li>• By default, the setup script created as part of a new InstallShield project is named setup.rul.</li></ul> |
| isrt_obl_file | <p>Specifies the name of the library file Isrt.obl. It is not necessary to include the full path for the library file, as long as the path is identified with the -libpath switch.</p> <p>Isrt.obl is in the following directory:</p> <p><i>InstallShield Program Files Folder\Script\Isrt\Lib</i></p> <p>This parameter is required unless you are using the -c or -l switch.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 4** • Command-Line Parameters for Compile.exe (cont.)

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>iswi_obl_file</b>      |  <p><b>Project</b> ▪ This parameter applies to the following project types:</p> <ul style="list-style-type: none"> <li>• Basic MSI</li> <li>• InstallScript MSI</li> </ul> <p>Specifies the name of the library file Iswi.obl. It is not necessary to include the full path for the library file, as long as the path is identified with the -libpath switch.</p> <p>Iswi.obl is in the following directory:</p> <p><i>InstallShield Program Files Folder\Script\Iswi\Lib</i></p> <p>This parameter is required unless you are using the -c or -l switch.</p> |
| <b>ifxobject_obl_file</b> |  <p><b>Project</b> ▪ This parameter applies to InstallScript Object projects.</p> <p>Specifies the name of the library file Ifxobject.obl. It is not necessary to include the full path for the library file, as long as the path is identified with the -libpath switch.</p> <p>Ifxobject.obl is in the following directory:</p> <p><i>InstallShield Program Files Folder\Script\Ifx\Lib</i></p> <p>This parameter is required unless you are using the -c or -l switch.</p>                                                                                 |

Switches

You can pass the following switches to the compiler. If you are not specifying the full path to the script files and library files, you must specify the location of the folders that contain those files by using the `-i` and `-libpath` switches (as noted in the `-i` and `-libpath` descriptions below). All of the other switches are optional.

Table 5 • Switches for Compile.exe

| Switch                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>/d</code> or <code>-d&lt;variable name=preprocessor define&gt;</code> | <p>Provides a preprocessor definition that is applicable to your InstallScript. Following is an example:</p> <pre>Compile.exe -dVARIABLENAME=Value</pre> <p>The variable name must be a valid InstallScript identifier; the value must be a constant. No space is permitted between the switch and the expression or within the expression.</p> <p>If you reference the preprocessor in InstallScript, use either of the following formats:</p> <ul style="list-style-type: none"><li>• <code>#ifdef VARIABLENAME</code></li><li>• <code>#if VARIABLENAME=Value</code></li></ul> <p>That is, for <code>#ifdef</code> statements, you can use just the value name. For <code>#if</code> statements, use a <code>name=value</code> pair.</p> <p>This parameter is optional.</p> <div><p><b>Note</b> • <i>It is recommended that you use this command-line parameter only if a preprocessor is not defined in either of the following areas in InstallShield:</i></p><ul style="list-style-type: none"><li>• On the Compile/Link tab of the Settings dialog box, which is displayed when you click Settings on the Build menu</li><li>• For Basic MSI and InstallScript MSI projects: In the Preprocessor Defines setting for the product configuration in the Releases view</li></ul><p><i>If you define a preprocessor in either of these areas in InstallShield and then you use the <code>-d</code> command-line parameter to define the same preprocessor, Compile.exe displays a cannot-define-symbol message to inform you that the preprocessor cannot be redefined through an InstallShield project or product configuration setting.</i></p></div> |
| <code>/e</code> or <code>-e</code>                                          | <p>Specifies the maximum number of error messages. The default value is 50. When the maximum number of error messages has been generated, compilation stops.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>/g</code> or <code>-g</code>                                          | <p>Specifies that a debugging information file should be produced. This file is given the name of the installation and extension <code>.dbg</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 5** ▪ Switches for Compile.exe (cont.)

| Switch                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>/gi or -gi</b>                  | <p>Specifies that debugging information should be included in the compiled script file, so a debugging information file is not needed.</p> <p>This option makes the compiled script larger and the installation slower, and makes it easier for others to reverse engineer your code, so it should typically not be used when creating your final installation for distribution to end users.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>/i or -i&lt;search path&gt;</b> | <p>Specifies a search path—a list of paths, each separated by a semicolon—that identifies the directories to search for source files that have been included in the main installation's InstallScript code through #include statements. Long path names must be enclosed in double quotation marks.</p> <div>  </div> <p><b>Project</b> ▪ For InstallScript and InstallScript Object projects, you must specify the full paths for the following folders:</p> <ul style="list-style-type: none"> <li>• InstallShield Program Files Folder\Script\Ifx\Include</li> <li>• InstallShield Program Files Folder\Script\Isrt\Include</li> </ul> <p>For Basic MSI and InstallScript MSI projects, you must specify the full paths for the following folders:</p> <ul style="list-style-type: none"> <li>• InstallShield Program Files Folder\Script\Iswi\Include</li> <li>• InstallShield Program Files Folder\Script\Isrt\Include</li> </ul> <p>The aforementioned directories contain the script header files for built-in InstallScript functionality. If you do not specify these folders, compiler errors occur.</p> |

**Table 5** ▪ Switches for Compile.exe (cont.)

| Switch                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/libpath or -libpath&lt;path&gt;</b>          | <p>Specifies a single path that identifies a directory to search for libraries such as Ifx.obl, Isrt.obl, or a custom library file. To specify multiple directories, use the -libpath switch multiple times. Long path names must be enclosed in double quotation marks.</p>  <p><b>Project</b> ▪ For InstallScript and InstallScript Object projects, you must specify the full paths for the following folders (unless you have used the full path with the library file names):</p> <ul style="list-style-type: none"> <li>● InstallShield Program Files Folder\Script\Ifx\Lib</li> <li>● InstallShield Program Files Folder\Script\Isrt\Lib</li> </ul> <p>For Basic MSI and InstallScript MSI projects, you must specify the full paths for the following folders (unless you have used the full path with the library file names):</p> <ul style="list-style-type: none"> <li>● InstallShield Program Files Folder\Script\Iswi\Lib</li> <li>● InstallShield Program Files Folder\Script\Isrt\Lib</li> </ul> <p>The aforementioned directories contain the libraries that define the built-in InstallScript functions. If you do not specify these folders or the full paths with the library names, compiler errors occur.</p> |
| <b>/o or -o&lt;compiled script file name&gt;</b> | <p>Specifies the file name to assign to the compiled script. Note the following:</p> <ul style="list-style-type: none"> <li>● The file name can include a drive designation and an absolute or relative path. If a path is not specified, the compiler will store the compiled script in the current directory.</li> <li>● If this parameter is not specified, the compiled script is given the name of the script file and the extension .inx and is stored in the current directory.</li> <li>● Long path and file names must be enclosed in double quotation marks.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>/q or -q</b>                                  | <p>Suppresses the output of the copyright message and version information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>/v or -v</b>                                  | <p>Sets the warning level to one of the following values:</p> <ul style="list-style-type: none"> <li>● <b>0</b>—Displays no warning messages.</li> <li>● <b>1</b>—Displays any system warning message that InstallShield is unable to handle.</li> <li>● <b>2</b>—Displays Level 1 messages, plus a message if string length exceeds the limit.</li> <li>● <b>3</b>—Displays all warning messages. This is the default setting.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 5 • Switches for Compile.exe (cont.)**

| Switch          | Description                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/w or -w</b> | Specifies the maximum number of warning messages. The default value is 50. When the maximum number of warning messages has been generated, compilation stops. |

## Additional Information

- When specifying file names, you can use either short or long file names; however, long file names must be enclosed within double quotation marks.
- If you specify a relative path to a file name (for example `..\..\My Functions`), that path must be relative to the current directory of the current drive at the time that you invoke the compiler.

## Examples

### Sample Command Line for an InstallScript Project

The following command line for an InstallScript project compiles the Setup.rul script file that is located in the C:\InstallShield 2021 Projects\My InstallScript Project\script files folder:

```
"C:\Program Files\InstallShield\2021\System\Compile.exe"
"C:\InstallShield 2021 Projects\My InstallScript Project\script files\setup.rul"
ifx.obl
isrt.obl
-libpath"C:\Program Files\InstallShield\2021\Script\Ifx\Lib"
-libpath"C:\Program Files\InstallShield\2021\Script\Isrt\Lib"
-i"C:\Program Files\InstallShield\2021\Script\Ifx\Include"
-i"C:\Program Files\InstallShield\2021\Script\Isrt\Include"
-i"C:\InstallShield 2021 Projects\My InstallScript Project\script files"
```

### Sample Command Line for an InstallScript MSI or Basic MSI Project

The following command line for an InstallScript MSI or Basic MSI project compiles the Setup.rul script file that is located in the C:\InstallShield 2021 Projects\My New Project\script files folder:

```
"C:\Program Files\InstallShield\2021\System\Compile.exe"
"C:\InstallShield 2021 Projects\My New Project\script files\setup.rul"
ISWI.obl
isrt.obl
-libpath"C:\Program Files\InstallShield\2021\Script\Iswi\Lib"
-libpath"C:\Program Files\InstallShield\2021\Script\Isrt\Lib"
-i"C:\Program Files\InstallShield\2021\Script\Ifx\Include"
-i"C:\Program Files\InstallShield\2021\Script\Isrt\Include"
-i"C:\InstallShield 2021 Projects\My New Project\script files"
```

# ISCmdBld.exe

You can build a release from the command line using ISCmdBld.exe for Windows Installer–based projects and for InstallScript projects. If your project includes InstallScript, ISCmdBld.exe also compiles it before building the release.

## Syntax

The following statement illustrates running ISCmdBld.exe to build the release **Othello Beta**:

```
ISCmdBld.exe -p "C:\InstallShield 2021 Projects\My Othello Project\Othello.ism" -r "Othello Beta" -c
COMP -a "Build 245"
```

The first parameter in the example above, starting with -p, is the path to the .ism file that you would like to build. Next, -r Othello Beta is the name of the release. The parameter -c COMP specifies that you would like your package to be compressed into one file. Finally, -a "Build 245" points to the specific product configuration.

If a command-line build completes without any errors, InstallShield sets the environment variable ERRORLEVEL to 0. If an error occurs during a command-line build, ERRORLEVEL is set to 1. If ERRORLEVEL is set to any other value, this typically indicates an invalid parameter was passed to ISCmdBld.exe, and the specific cause of the error is displayed in the Command Prompt window in which ISCmdBld.exe was running.

## Command-Line Parameters

**Project** ▪ Some of the ISCmdBld.exe command-line parameters are applicable to only certain project types.

**Table 6** ▪ ISCmdBld.exe Command-Line Parameters

| Parameter                               | Project Type                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-a &lt;product configuration&gt;</b> | Basic MSI, InstallScript MSI, Merge Module                                                                      | This parameter specifies the product configuration for the release. If it does not exist, it is created. Although this parameter is not required, you should include it if you are including the parameter for the release name.                                                                                                                                                                                                                                                                                                                                                                |
| <b>-b &lt;build location&gt;</b>        | Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI | <p>The fully qualified path to the folder where you want the output folders and files to be placed. UNC paths are acceptable. The built installation's files will be located in the Disk Images\Disk1 subfolder of the location that you specify.</p> <p>This parameter is optional. If it is left unspecified, the build will place the build package and files in the directory specified in the File Locations tab of the Options dialog box.</p> <p>Enclose long file names in quotation marks.</p>                                                                                         |
| <b>-c &lt;release configuration&gt;</b> | Basic MSI, InstallScript MSI                                                                                    | <p>This parameter enables you to specify whether your release is compressed into one file or remains uncompressed in multiple files. The valid arguments for this parameter are COMP and UNCOMP. To specify that your release be compressed into one file, use the COMP argument. If you do not want your release compressed, use the UNCOMP argument.</p> <p>If the parameter is omitted for a release that already exists, the configuration is based on what was specified in the InstallShield interface. If the parameter is omitted for a new release, the files remain uncompressed.</p> |

**Table 6 •** ISCmdBld.exe Command-Line Parameters (cont.)

| Parameter                                                  | Project Type                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-customsign_args</b><br><b>&lt;arguments&gt;</b>        | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module, Suite/<br>Advanced UI | <p>Use this parameter to specify the command-line argument for a custom signing tool's configuration. For example:</p> <pre>IsCmdBld.exe -p "C:\InstallShield 2026 Projects\MyProject1.ism" -sign_output "Y" -customsign_path "C:\Program Files (x86)\Windows Kits\10\bin\10.0.19041.0\x64\signtool.exe" - customsign_args "sign /v /a /fd SHA256 /tr http:// timestamp.digicert.com /td SHA256 [filename]"</pre> <p></p> <p><b>Important •</b> Specifying <code>-sign_output "Y"</code> is a prerequisite for using the <code>-customsign_path</code> and <code>-customsign_args</code> parameters.</p> <p>The <code>[filename]</code> variable is a place holder for full file path to be signed. It resolves to full path of the binary file to be signed during build time. By default, a file path will be added at the end of an argument and passed to a custom sign tool. Instead of using a hard-coded path, you can utilize the path variables, environment variables, or property names that are defined within your project.</p> <p></p> <p><b>Note •</b> When using a property name in place of the <code>[filename]</code> variable, ensure that it is enclosed within square brackets (<code>[]</code>).</p> |
| <b>-customsign_path</b><br><b>&lt;path to signtool&gt;</b> | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module, Suite/<br>Advanced UI | <p>Use this parameter to specify the location of a custom signing tool that will be used to digitally sign the build-generated file (setup.exe). For example:</p> <pre>ISCmdBld.exe -customsign_path "C:\Users\Admin\Documents\sign.bat"</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 6** • ISCmdBld.exe Command-Line Parameters (cont.)

| Parameter                                           | Project Type                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------|-------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-d &lt;variable name=preprocessor define&gt;</b> | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object | <p>Use this parameter to provide a preprocessor definition that is applicable to your InstallScript. To specify more than one preprocessor definition, separate each with a comma, as in the following example:</p> <pre>ISCmdBld.exe -d VARIABLENAME1=Value1,VARIABLENAME2=Value2</pre> <p>If you reference the preprocessor in InstallScript, use either of the following formats:</p> <ul style="list-style-type: none"> <li>• <code>#ifdef VARIABLENAME</code></li> <li>• <code>#if VARIABLENAME=Value</code></li> </ul> <p>That is, for <code>#ifdef</code> statements, you can use just the value name. For <code>#if</code> statements, use a <code>name=value</code> pair.</p> <p>This parameter is optional.</p> <div>  <p><b>Note</b> ▪ <i>It is recommended that you use this command-line parameter only if a preprocessor is not defined in either of the following areas in InstallShield:</i></p> <ul style="list-style-type: none"> <li>• On the Compile/Link tab of the Settings dialog box, which is displayed when you click Settings on the Build menu</li> <li>• For Basic MSI and InstallScript MSI projects: In the Preprocessor Defines setting for the product configuration in the Releases view</li> </ul> <p><i>If you define a preprocessor in either of these areas in InstallShield and then you use the -d command-line parameter to define the same preprocessor, ISCmdBld.exe displays a cannot-define-symbol message to inform you that the preprocessor cannot be redefined through an InstallShield project or product configuration setting.</i></p> </div> |
| <b>-e &lt;Y/N&gt;</b>                               | Basic MSI, InstallScript MSI, Merge Module                        | <p>For installation projects, this parameter specifies whether you want to create a Setup.exe file along with your installation. Specify <code>-e Y</code> to build Setup.exe or <code>-e N</code> to just create an installation.</p> <p>For merge module projects, the meaning of <code>-e</code> is different from installation projects. Specifying <code>-e n</code> will cause the merge module to be built and then copied to the merge modules folder. Specifying <code>-e Y</code> will cause the merge module to only be built but not copied to the merge modules folder.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 6 •** ISCmdBld.exe Command-Line Parameters (cont.)

| Parameter                                    | Project Type                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------|---------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-f &lt;release flags&gt;</b>              | Advanced UI,<br>Basic MSI,<br>InstallScript<br>MSI, Suite/<br>Advanced UI                         | Use this parameter to specify any release flags that you would like to include in your release. Separate multiple flags with commas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>-fc &lt;Launcher Copy Rights&gt;</b>      | Basic MSI,<br>InstallScript MSI                                                                   | If you want to override the default copyright notice for Setup.exe with your required product copyright notice, use this parameter to specify the product copyright notice, such as, -fc "Copyright © 2024 Flexera. All Rights Reserved".                                                                                                                                                                                                                                                                                                                                                                              |
| <b>-fd &lt;file description&gt;</b>          | Basic MSI,<br>InstallScript MSI                                                                   | If you want to override the default file description for Setup.exe with your required description, use this parameter to specify the file description, such as, -fd "Setup Launcher Unicode".                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>-fv &lt;version number&gt;</b>            | Basic MSI,<br>InstallScript MSI                                                                   | <p>If you want to override the default file version for Setup.exe with your own version number, use this parameter to specify the file version, such as -fv 2.5.0.0. This is an optional parameter.</p> <div>  <p><b>Note</b> ▪ The file version always contains four fields. If you specify fewer than four fields for your file version, the remaining fields are filled with zeros. For example, if you specify a file version of 1.1, the file version that is used in the version resources of Setup.exe is 1.1.0.0.</p> </div> |
| <b>-g &lt;minimum target MSI version&gt;</b> | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module                                               | Use this parameter to specify the minimum version of Windows Installer that the installation requires on the target machine—for example, 2.0.2600.0. This parameter is optional. The default is the latest version of Windows Installer that the InstallShield interface supports.                                                                                                                                                                                                                                                                                                                                     |
| <b>-h</b>                                    | Basic MSI,<br>InstallScript MSI                                                                   | To skip the upgrade validators at the end of the build, use this parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>-i &lt;.ini file path&gt;</b>             | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module | <p>Instead of passing all of your parameters on the command line, you can include them all in an initialization (.ini) file and call that file from the command line. For more information, see <a href="#">Passing Command-Line Build Parameters in an .ini File</a>.</p> <p>Absolute and relative paths are acceptable.</p> <p>Enclose long file names in quotation marks.</p>                                                                                                                                                                                                                                       |

**Table 6 •** ISCmdBld.exe Command-Line Parameters (cont.)

| Parameter                                                         | Project Type                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-j &lt;minimum target Microsoft .NET Framework version&gt;</b> | Basic MSI, InstallScript MSI                                                                                    | This parameter specifies the minimum version of the .NET Framework that the installation requires on the target machine—for example, 1.0.3705.2. This parameter is optional. The default is the latest version of the .NET Framework that the InstallShield interface supports.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>-l &lt;path variable&gt;="new path"</b>                        | Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI | <p>Use this parameter to override a path variable that has been specified in the Path Variables view. You can specify this parameter multiple times, once for each path variable override. For example:</p> <pre>ISCmdBld.exe -l VariableName="C:\Path" -l VariableName2="C:\Path2"</pre> <p>To reference a file in a sibling project that is within the same Visual Studio solution folder, use the predefined path variable called VSSolutionFolder. For more information, see <a href="#">Using the VSSolutionFolder Path Variable with Visual Studio Solutions</a>.</p>                                                                                                    |
| <b>-licCheckTimeOut &lt;seconds&gt;</b>                           | Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI | <p>Use this parameter to set the time period to check the availability of the license from the license server.</p> <p>For example, in the following command line, IsCmdBld waits for the license availability in the configured license server for the 40 secs and checks the availability in 15 secs intervals. If the license is available before 40 secs, then the build continues with the available license else the build fails with the existing reason (failed to get the license).</p> <pre>ISCmdBld.exe -p "C:\InstallShield 2021 projects\TestProj.ism" -licCheckTimeOut 40</pre>                                                                                   |
| <b>-m &lt;.cub file name&gt;</b>                                  | Basic MSI, InstallScript MSI, Merge Module                                                                      | <p>Use this parameter if you want to validate the installation or merge module package after it is built. Pass the path of the .cub file name with this parameter.</p> <p>Absolute and relative paths are acceptable. To use multiple .cub files, separate each path with a semicolon (;). Enclose long file names in quotation marks.</p> <p>For example, in the following command line, the -m parameter indicates that validation should be performed with the InstallShield Validation Suite for Windows 7 (ISWin7.cub) and the Full MSI Validation Suite (darice.cub):</p> <pre>ISCmdBld.exe -m "..\Support\Validation\ISWin7.cub;..\Support\Validation\darice.cub"</pre> |

**Table 6 •** ISCmdBld.exe Command-Line Parameters (cont.)

| Parameter                                        | Project Type                                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-n</b>                                        | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module                                        | <p>Specify this parameter if you do not want Setup.ru1 to be compiled as part of the build process.</p> <p>Note that if you are building from the command line and specifying an .ini file with the build settings, you can specify the following in the [Project] section of the .ini file, instead of adding the -n command line build flag:</p> <pre>[Project] CompileScript=No</pre> <p>Like the command-line build flag, this CompileScript keyword helps you specify whether Setup.ru1 should be compiled as part of the build process.</p>  <p><b>Note •</b> The -n parameter cannot be used with the -q3 parameter.</p> |
| <b>-o &lt;merge module search path&gt;</b>       | Basic MSI,<br>InstallScript,<br>InstallScript MSI                                                                                        | <p>This parameter specifies one or more comma-delimited folders that contain the merge module files (.msm) that are referenced by your project.</p> <p>InstallShield provides additional ways for specifying the folders that contain merge modules. For more information, see <a href="#">Specifying the Directories that Contain Merge Modules</a>.</p>                                                                                                                                                                                                                                                                                                                                                        |
| <b>-p &lt;project location&gt;</b>               | Advanced UI,<br>Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module, Suite/<br>Advanced UI | <p>Pass the path to the project (.ism) file. This path can be fully qualified, relative, or just the file name. If only the project file name is passed, the file is retrieved relative to the current working directory. For example:</p> <pre>ISCmdBld.exe -p "C:\InstallShield 2021 Projects\MyProject1\MyProject1.ism"</pre> <p>UNC paths are also acceptable. Enclose long file names in quotation marks.</p> <p>This is the only required parameter.</p>                                                                                                                                                                                                                                                   |
| <b>-patch_config &lt;patch configuration&gt;</b> | Basic MSI,<br>InstallScript MSI                                                                                                          | <p>Use this parameter to build a standard patch. Pass the name of the patch configuration in the Patch Design view that you want to build. For example, the following command line builds the patch configuration called Version 1.2 in the MyProject1.ism project:</p> <pre>ISCmdBld.exe -p "C:\InstallShield 2021 Projects\MyProject1\MyProject1.ism" -patch_config "Version 1.2"</pre>                                                                                                                                                                                                                                                                                                                        |

**Table 6** • ISCmdBld.exe Command-Line Parameters (cont.)

| Parameter                                                                  | Project Type                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-prqdownload</b>                                                        | Basic MSI,<br>InstallScript,<br>InstallScript MSI   | <p>Use this parameter to direct the Standalone build to automatically download missing InstallShield prerequisite binary files into the appropriate projects's directory during build time. For example, the following command line downloads the missing InstallShield prerequisite binary files for the project file:</p> <pre>Iscommandbld.exe -p "projectfile" -prqdownload</pre>  <p><b>Note</b> ▪ When a Suite/Advanced UI project build using the <i>Iscommandbld.exe</i> without this parameter, the required InstallShield prerequisite binary files for the ISM package get automatically downloaded into the project file. Hence, this parameter is not applicable for the Suite/Advanced UI project.</p> |
| <b>-prqpath<br/>&lt;InstallShield<br/>prerequisite search<br/>path&gt;</b> | Basic MSI,<br>InstallScript,<br>InstallScript MSI   | <p>This parameter specifies one or more comma-delimited folders that contain the InstallShield prerequisite files (.prq) that are referenced by your project.</p> <p>InstallShield provides additional ways for specifying the folders that contain InstallShield prerequisite files. For more information, see <a href="#">Specifying the Directories that Contain InstallShield Prerequisites</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>-q1</b>                                                                 | Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module | <p>Builds only the Windows Installer tables for your release. If you have not built this installation already, a new .msi file is created, but no files are added to your installation. If you have built your installation already, the .msi file is updated when all the tables are built, but, again no files are transferred. Ideally, this option is to be used to test the user interface of your installation.</p>  <p><b>Note</b> ▪ The <i>-q1</i> parameter cannot be used with the <i>-q2</i> or <i>-q3</i> parameters.</p>                                                                                                                                                                              |

**Table 6 •** ISCmdBld.exe Command-Line Parameters (cont.)

| Parameter                      | Project Type                                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-q2</b>                     | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module                                        | <p>For Basic MSI, InstallScript MSI, and Merge Module projects: Builds the Windows Installer tables and refreshes files. This option rebuilds your .msi file and updates the Files table, including any new or changed files in your installation. Changed files are updated only if the size or time stamp differs from the copy already included in the build. References to deleted files are removed from the installation, but the file remains in the build location. This type of build can be run only after a complete build has been performed, and it works only when the media is an uncompressed network image.</p> <p>For InstallScript and InstallScript Object projects: Rebuilds only those portions of the release that have changed since the last build. If this parameter is not used, the entire file media library is rebuilt.</p> <p></p> <p><b>Note ▪</b> The -q2 parameter cannot be used with the -q1 or -q3 parameters.</p> |
| <b>-q3</b>                     | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module                                        | <p>Compiles only Setup.rul.</p> <p>For Basic MSI projects, this parameter also streams ISSetup.dll into the Binary table of the .msi package, if one was previously built.</p> <p></p> <p><b>Note ▪</b> The -q3 parameter cannot be used with the -q2 or -q3, or -n parameters.</p> <p></p> <p><b>Note ▪</b> This parameter does not upgrade the project. If your project was created with InstallShield Developer 8 or earlier, you should upgrade it to the latest version of InstallShield before using -q3. For example, use -u to upgrade.</p>                                                                                                                                                                                                                                                                                                                |
| <b>-r &lt;release name&gt;</b> | Advanced UI,<br>Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module, Suite/<br>Advanced UI | <p>The release name as specified in the Releases view. You can use an existing release name or create a new one.</p> <p>Although this parameter is not required, you should include it if you are including -a, the parameter for product configurations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 6** • ISCmdBld.exe Command-Line Parameters (cont.)

| Parameter                                       | Project Type                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-s</b>                                       | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module                        | This parameter enables you to build your release in silent mode. Silent builds are useful if you want to run the build without displaying any errors or warning messages.<br><br>This parameter is optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>-se or -SE</b>                               | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI, Suite/<br>Advanced UI,<br>QuickPatch,<br>Merge Module              | This parameter allows you to run the build without displaying any information except error messages. Use this parameter to build and get only build errors (errors, fatal errors, and validation errors).<br><br>This parameter is optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>-sign_output &lt;Y/N&gt;</b>                 | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module, Suite/<br>Advanced UI | Use this parameter to specify whether the build-generated file (setup.exe) must be digitally signed. For example: <ul style="list-style-type: none"> <li>You can use ISCmdBld.exe -sign_output "Y" to enable digital signing.</li> <li>You can use ISCmdBld.exe -sign_output "N" to skip digital signing.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>-t &lt;Microsoft .NET Framework path&gt;</b> | Basic MSI,<br>InstallScript MSI                                                                                          | Regasm.exe and InstallUtilLib.dll are utilities that are included with each version of the .NET Framework. This parameter specifies the path for the directory that contains the installed 32-bit version of these files that you want to use at build time for releases that include .NET installer classes and COM interop. This is not the path to .NET Framework redistributable files.<br><br><div style="border: 1px solid black; padding: 5px; margin-top: 10px;">  </div> <p><b>Note</b> ▪ If you are using InstallShield on a 64-bit system, ISCmdBld.exe determines the location of the corresponding 64-bit version of the .NET Framework based on the path that you specify for this parameter, and ISCmdBld.exe uses the 64-bit location of Regasm.exe and InstallUtilLib.dll when appropriate.</p> |
| <b>-u</b>                                       | Basic MSI                                                                                                                | This parameter enables you to upgrade—but not build—your release. You can use this parameter to upgrade an installation project that you created using InstallShield—Windows Installer Edition version 2.03 or earlier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 6 •** ISCmdBld.exe Command-Line Parameters (cont.)

| Parameter                         | Project Type                                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-v</b>                         | Advanced UI,<br>Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module, Suite/<br>Advanced UI | This parameter enables you to create a verbose build log file that may be useful if Revenera Support is helping you troubleshoot an issue with your installation.                                                                                                                                                                                                                                                                          |
| <b>-w</b>                         | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module                                        | This parameter treats warnings that occur during the build process as errors. Each warning increments the error count by one.                                                                                                                                                                                                                                                                                                              |
| <b>-x</b>                         | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI,<br>InstallScript<br>Object, Merge<br>Module                                        | If you want the build to stop when it encounters an error, use the -x parameter. If you want the build to stop when it encounters a warning, use this parameter in conjunction with the -w parameter.                                                                                                                                                                                                                                      |
| <b>-y &lt;product version&gt;</b> | Advanced UI,<br>Basic MSI,<br>InstallScript<br>MSI, Merge<br>Module, Suite/<br>Advanced UI                                               | <p>This parameter enables you to specify a product version from the command line. This is especially helpful if you want to increment the build version (the third field) of the product version. For example, to set the product version to 1.0.5:</p> <pre>ISCmdBld.exe -y "1.0.5"</pre> <p>For information on valid product version numbers, see <a href="#">Specifying the Product Version</a>.</p> <p>This parameter is optional.</p> |

**Table 6** • ISCmdBld.exe Command-Line Parameters (cont.)

| Parameter                                      | Project Type                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-z &lt;property name=property value&gt;</b> | Advanced UI, Basic MSI, InstallScript MSI, Merge Module, Suite/Advanced UI                                      | <p>In Basic MSI, InstallScript MSI, and Merge Module projects, this parameter enables you to override the value of a Windows Installer property. In Advanced UI and Suite/Advanced UI projects, this parameter enables you to override the value of an Advanced UI or Suite/Advanced UI property.</p> <p>For example, to set the value of the property called <code>PropertyName</code> to <code>PropertyValue</code>, use the following command line:</p> <pre>ISCmdBld.exe -z PropertyName=PropertyValue</pre> <p>If you want to set the value to a string that includes one or more spaces, use quotation marks; for example, to set the value of the property called <code>PropertyName</code> to <code>My Property Value</code>, use the following command line:</p> <pre>ISCmdBld.exe -z "PropertyName=My Property Value"</pre> <p>If you specify a property that does not exist in the Property table, InstallShield creates the property in the installation that it builds.</p> <p>If you specify both the <code>-y</code> parameter to override the product version, and the <code>-z</code> parameter to override the <code>ProductVersion</code> property, InstallShield uses the value specified for the <code>-y</code> parameter.</p> <p>This parameter is optional.</p> |
| <b>cert_password</b>                           | Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI | <p>This parameter specifies the PFX digital certificate password or EV/OV token password based on the signing options configured in the project. If it is not specified, the password configured in the project is used to sign the files.</p> <p>This is an optional parameter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## ISBuild.exe

**Project** • This information applies to the InstallScript projects.

**Important** • *ISCmdBld.exe* should be used instead of *ISBuild.exe* to build the release, as *ISBuild.exe* has been deprecated.

ISBuild.exe is a command-line tool that is available for legacy InstallScript projects. The following parameters are associated with ISBuild.exe:

**Table 7** ▪ Command-Line Parameters for ISBuild.exe

| Parameter                        | Description                                                                                                                                                                                                                                                        |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-p &lt;project file&gt;</b>   | This specifies the fully qualified path and file name of the project file. By default, the project file is in the following location:<br><br>C:\InstallShield 2021 Projects\Project Name\Project File<br><br>This parameter should be enclosed in quotation marks. |
| <b>-m &lt;media name&gt;</b>     | This specifies the media name for the media that will be built. This parameter should be enclosed in quotation marks.                                                                                                                                              |
| <b>-b &lt;build location&gt;</b> | This specifies the fully qualified path to the folder where you want the output folders and files to be placed. This parameter is optional.                                                                                                                        |
| <b>-s</b>                        | This runs ISBuild.exe in silent mode. This parameter is optional.                                                                                                                                                                                                  |
| <b>-r</b>                        | This indicates that the media should refresh the build. The default is a complete rebuild. This parameter is optional.                                                                                                                                             |

## IISscan.exe

**Edition** ▪ The ability to import IIS data into an InstallShield project is available only in the Premier edition of InstallShield.

The IIS scanner (IISscan.exe) is a tool that scans an IIS Web site and records the values of the settings that you can configure in the Internet Information Services view in InstallShield. IISscan.exe creates an XML file that contains all of the values. You can use this XML file to import the values into the Internet Information Services view. Then you can modify the settings as needed.

When you use IISscan.exe to scan a Web site, you must place the IISscan.exe file on the machine that contains the IIS Web site.

**Note** ▪ IISscan.exe requires administrative privileges. Therefore, you may need to launch it from an elevated Command Prompt window.

IISscan.exe is installed in the following location:

InstallShield Program Files Folder\System

### Syntax

```
iisscan.exe -website "Site Name" -outfile "C:\PathToFile\FileName.xml"
```

## Parameters

**Table 8** • Command-Line Parameters for IISscan.exe

| Parameter       | Description                                                                                                                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-website</b> | Specify the name of the Web site on the IIS server that you want to scan.                                                                                                                                                                                                            |
| <b>-outfile</b> | Specify the full path and name of the XML file that you want the scanner to create.<br><br>This parameter is optional. If you do not pass this parameter, the IIS scanner records the IIS settings in a file called iisscan.xml in the same directory that contains the IIS scanner. |

**Tip** • InstallShield lets you configure filters if you want to prevent certain IIS data—such as Web sites, applications, virtual directories, application pool, or any of their settings—from ever being imported into the Internet Information Services view. To learn more, see [Filtering IIS Data When Importing a Web Site and Its Settings into an InstallShield Project](#).

## iSign.exe

**Project** • This information applies to the following project types:

- InstallScript
- InstallScript Object

Use the command-line tool iSign.exe to digitally sign a release of an InstallScript project from the command line after you have built the release.

iSign.exe is in the following directory:

*InstallShield Program Files Folder\System*

iSign.exe lets you choose between the following options:

- You can specify the .pfx certificate file on your machine that you want to use for signing.
- You can reference a certificate store that contains the certificate that you want to use for signing.

## Syntax

iSign.exe [options] *PathToData1.hdrFile*

For example, for signing with a .pfx file:

```
iSign.exe -pfx "C:\Temp\MyFile.pfx" -p "Password" "C:\InstallShield 2026\MyProject\Media\Release 1\Disk  
Images\Disk1\data1.hdr"
```

For signing with a certificate in a certificate store:

```
iSign.exe -store "Root" -sl "Machine" ss "My Certificate" "C:\InstallShield 2026\MyProject\Media\Release
1\Disk Images\Disk1\data1.hdr"
```

## Command-Line Parameters

Following is a list of the parameters that you can use with iSign.exe. Note that some are available only if you are using a .pfx file, and some are available only if you are using a certificate in a certificate store.

**Table 9** • Command-Line Parameters for iSign.exe

| Parameter                             | Signing Method                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-pfx &lt;path to .pfx file&gt;</b> | .pfx file                        | Specify the fully qualified path to the .pfx file that contains the certificate that you want to use to sign your release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>-p &lt;password&gt;</b>            | .pfx file                        | <p>If the .pfx file that you are using has a password, specify it with this parameter.</p> <p>If your certificate is protected by a password but you do not enter it for this parameter, signing with a .pfx file fails.</p>  <p><b>Note</b> ▪ This parameter is not applicable if the certificate that you are using for signing is in a certificate store. Note that if the certificate was imported into the store with password protection, you will be prompted to enter the password while signing with iSign.exe.</p> |
| <b>-store &lt;store name&gt;</b>      | certificate in certificate store | <p>Specify the name of the certificate store that contains the certificate that you want to use. Available options are:</p> <ul style="list-style-type: none"> <li>• My</li> <li>• Root</li> <li>• Trust</li> <li>• CA</li> </ul>                                                                                                                                                                                                                                                                                                                                                                             |
| <b>-sl &lt;store location&gt;</b>     | certificate in certificate store | <p>Specify the location of the certificate store that contains the certificate that you want to use. Available options are:</p> <ul style="list-style-type: none"> <li>• User</li> <li>• Machine</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>-ss &lt;subject&gt;</b>            | certificate in certificate store | Specify the subject of the certificate that you want to use. This parameter is applicable if the certificate is in a certificate store.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# ReleasePackager.exe

---

**Project** ▪ *This information applies to the InstallScript projects.*

Use ReleasePackager.exe to build a self-extracting executable file from the command line. This can be useful if you are building from a batch file.

ReleasePackager.exe is installed in the following location:

*InstallShield Program Files Folder\System*

## Syntax

```
ReleasePackager.exe "disk_images_folder" "package_file" ["icon_file" [icon_index]]
```

## Parameters

**Table 10** • Command-Line Parameters for ReleasePackager.exe

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>disk_images_folder</b> | This optional parameter specifies the folder that contains the disk images to be incorporated in the self-extracting executable file. A typical value is:<br><br>C:\InstallShield 2021 Projects\ProjectName\Media\Releasename\Disk Images                                                                                                                                                                                                                                                                     |
| <b>package_file</b>       | This parameter specifies the fully qualified name of the self-extracting executable file. A typical value is:<br><br>C:\InstallShield 2021<br>Projects\Projectname\Media\Releasename\Package\Packagename.exe                                                                                                                                                                                                                                                                                                  |
| <b>icon_file</b>          | This optional parameter specifies the fully qualified name of the file that contains the icon you want to use for your self-extracting executable file.                                                                                                                                                                                                                                                                                                                                                       |
| <b>icon_index</b>         | This optional parameter specifies the numeric index of the icon from <i>icon_file</i> that you want to use for your self-extracting executable file. If you do not specify an index, the icon at index 0 is used.                                                                                                                                                                                                                                                                                             |
| <b>-s</b>                 | This optional parameter is available for running ReleasePackager.exe in silent mode. To pass this parameter to ReleasePackager.exe, the syntax is as follows:<br><br>ReleasePackager.exe "disk_images_folder" "package_file" ["icon_file"<br>[icon_index]] -s<br><br>Note that the -s parameter must be specified after the other parameters. If you do not want to specify an icon file or icon index, you must specify the default values of a null string ("") for the icon file and 0 for the icon index. |

## Example

```
ReleasePackager.exe "C:\InstallShield 2021 Projects\My Project\Media\My Release\Disk Images"
"C:\InstallShield 2021 Projects\My Project\Media\My Release\Package\MyPackage.exe"
"C:\My Icon Files\MyIcons.dll" 2 -s
```

## SetupIni.exe

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

SetupIni.exe is a command-line tool that enables you to modify a Setup.ini file that is embedded in a Setup.exe or Update.exe file. Setup.ini is an initialization file that is created during the build process of installation projects to control certain elements of the installation.

SetupIni.exe is installed in the following location:

*InstallShield Program Files Folder\System*

Syntax

SetupIni.exe *PathToSetup.exe Section Key Value*

Parameters

Table 11 • Command-Line Parameters for SetupIni.exe

| Parameter       | Description                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PathToSetup.exe | Specify the path and file name to the Setup.exe file that contains the Setup.ini file that you want to modify.<br><br>If the path contains spaces, enclose it within quotation marks. |
| Section         | Specify the name of the section that you want to modify.                                                                                                                              |
| Key             | Specify the name of the key whose value you want to set.                                                                                                                              |
| Value           | Specify the value that you want to use for the specified key.<br><br>If the value contains spaces, enclose it within quotation marks.                                                 |

Example

SetupIni.exe "C:\InstallShield 2021 Projects\My Project\Media\My Release\Package\MySetup.exe" Startup  
CmdLine MYPROPERTY="MyValue"

MsiExec.exe Command-Line Parameters

MsiExec.exe is the executable program of the Windows Installer used to interpret installation packages and install products on target systems. After you [build your release](#), you can install your Windows Installer package (.msi) from the command line.

Your Windows Installer package can be accessed from the folder that contains your built release. The default location is as follows:

C:\InstallShield 2021 Projects\ProjectName\ReleaseName\DiskImages\Disk1\ProductName.msi

After building a release of your product, you can install it from the command line:

msiexec /i "C:\InstallShield 2021 Projects\ProjectName\ReleaseName\DiskImages\Disk1\ProductName.msi"

The table below provides a detailed description of MsiExec.exe command-line parameters.

**Table 12 • MsiExec.exe Command-Line Parameters**

| Parameter                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Table 12 ▪ MsiExec.exe Command-Line Parameters (cont.)

| Parameter                                                                                                                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>/x &lt;package&gt; or &lt;product code&gt;</code>                                                                                                                                     | <p>The <code>/x</code> option uninstalls a product.</p> <div></div> <p><b>Project ▪</b> For InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler): If you try to uninstall the product through the command line using the statement <code>Msiexec.exe /x {ProductCode}</code>, the uninstallation may be successful. However, the Windows Installer displays an error dialog near the end of the uninstallation. The error dialog indicates that the Windows Installer service could not be accessed.</p> <p>To perform an uninstallation from the command line in this scenario, the current recommended method is to use one of the following:</p> <pre>msiexec.exe /i {ProductCode} REMOVE=ALL</pre> <pre>msiexec.exe /x {ProductCode} /qn</pre> <p>This is not necessary if your InstallScript MSI project is using the traditional style for the InstallScript UI (which uses the InstallScript engine as an external UI handler).</p> <p>To learn more, see <a href="#">Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations</a>.</p> |
| <code>/j [u m] &lt;package&gt;</code><br><code>/j [u m] &lt;package&gt; /t &lt;transform list&gt;</code><br><code>/j [u m] &lt;package&gt; /g</code><br><code>/j &lt;language ID&gt;</code> | <p>Building with the <code>/j &lt;package&gt;</code> option advertises the components of your application on the end user's computer</p> <ul style="list-style-type: none"><li>• <code>u</code> advertises components only to the current user</li><li>• <code>m</code> advertises components to all users of the computer</li><li>• <code>g</code> specifies language ID</li><li>• <code>t</code> applies a transform to your advertised product</li></ul> <p>Transforms allow the synchronization of applications across different languages. For example, if you upgrade the English version of your product, you could apply a transform to automatically upgrade the French version of your product.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 12** • MsiExec.exe Command-Line Parameters (cont.)

| Parameter                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/L[i w e r u c m o p v x + ! *] &lt;log file&gt;</b> | <p>Use the /L option to specify the path to the log file. Optionally include one or more of the following flags to indicate which information to record in the log file:</p> <ul style="list-style-type: none"> <li>• i logs status messages.</li> <li>• w logs non-fatal warning messages.</li> <li>• e logs any error messages.</li> <li>• a logs the commencement of action sequences.</li> <li>• r logs action-specific records.</li> <li>• u logs user requests.</li> <li>• c logs initial user interface parameters.</li> <li>• m logs out-of-memory messages.</li> <li>• o logs out-of-disk-space messages.</li> <li>• p logs all of the properties and their values at the end of the installation.</li> <li>• v logs verbose output.</li> <li>• x logs extra debugging information.</li> <li>• + appends the information to an existing log file.</li> <li>• ! flushes each line to the log.</li> <li>• * is a wild-card character that enables you to log all information (excluding the verbose output that v provides and the extra debugging information that x provides).</li> </ul> <p>For example, to generate a log file that logs everything verbosely, use the following:</p> <pre>/L*v "C:\MyLogFiles\package.log"</pre> |
| <b>/p &lt;patch package&gt;</b>                         | <p>Use the /p option to apply a patch to an installed product. To patch an installed administrative image, combine this option with /a as shown:</p> <pre>/p PatchPackage /a Package</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 12** • MsiExec.exe Command-Line Parameters (cont.)

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/q [n b r f]</b>         | <p>The /q option is used to set the user interface level in conjunction with the following flags:</p> <ul style="list-style-type: none"> <li>• q or qn creates no user interface</li> <li>• qb creates a basic user interface</li> </ul> <p>The following user interface settings display a modal dialog box at the end of installation:</p> <ul style="list-style-type: none"> <li>• qr displays a reduced user interface</li> <li>• qf displays a full user interface</li> <li>• qn+ displays no user interface</li> <li>• qb+ displays a basic user interface</li> </ul>            |
| <b>/? or /h</b>             | Either command displays Windows Installer copyright information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>/y &lt;file name&gt;</b> | This command calls the DllRegisterServer entry-point function of the DLL or OCX file specified in <file name>.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>/z &lt;file name&gt;</b> | This command calls the DllUnregisterServer entry-point function of the DLL or OCX file specified in <file name>.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>/n {product code}</b>    | <p>The /n &lt;product code&gt; option is available for patches that are created in the Patch Design view for <b>Basic MSI projects that support the installation of multiple instances of a product</b>.</p> <p>Use the /n option with the /p option to specify the product code of the instance to which you want to apply a patch. For example:</p> <pre>msiexec /p mypatch.msp /n {00000001-0002-0000-0000-624474736554}</pre>                                                                                                                                                      |
| <b>TRANSFORMS</b>           | <p>Use the TRANSFORMS command-line parameter to specify any transforms that you would like applied to your base package. Your transform command-line call might look something like this:</p> <pre>msiexec /i "C:\InstallShield 2021 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello.msi" TRANSFORMS="New Transform 1.mst"</pre> <p>You can separate multiple transforms with a semicolon. Because of this, it is recommended that you do not use semicolons in the name of your transform because the Windows Installer service will interpret those incorrectly.</p> |

**Table 12** ▪ MsiExec.exe Command-Line Parameters (cont.)

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Properties</b> | <p>All public properties can be set or modified from the command line. Public properties are distinguished from private properties by the fact that they are in all capital letters. For example, COMPANYNAME is a public property.</p> <p>To set a property from the command line, use the following syntax: <i>PROPERTY=VALUE</i>. If you wanted to change the value of COMPANYNAME, you would enter:</p> <pre>msiexec /i "C:\InstallShield 2021 Projects\Othello\Trial<br/>Version\Release\DiskImages\Disk1\Othello.msi" COMPANYNAME="My<br/>Software Company"</pre> |

For information on passing MsiExec.exe command-line parameters through Setup.exe, see [Setup.exe and Update.exe Command-Line Parameters](#).

# Setup.exe and Update.exe Command-Line Parameters

Setup.exe can accept a number of command-line parameters. Update.exe (available only for Basic MSI and InstallScript MSI projects) accepts nearly all of the same command-line parameters. Using these parameters, end users can specify such data as the language that the installation should run in and whether to launch Setup.exe silently. For Basic MSI and InstallScript MSI, end users can also pass parameters through Setup.exe to the included .msi file.

**Note** ▪ Command-line options that require a parameter must be specified with no space between the option and its parameter. For example, *Setup.exe /v "ALLUSERS=2"* is valid, while *Setup.exe /v "ALLUSERS=2"* is not. Quotation marks around an option's parameter are required only if the parameter contains spaces. If a path within a parameter contains spaces, you may need to use quotation marks within quotation marks, as in the following example:

*Setup.exe /v "INSTALLDIR=\"c:\My Files\""*

**Project** ▪ Some of the command-line options apply to only certain project types. Project-specific information is listed for each option.

## Built-In Command-Line Parameters

This section describes valid command-line parameters for Setup.exe. The parameters are organized into the following categories:

- [Silent Installations](#)
- [Special Installation Modes](#)
- [Passing Data to the Installation](#)

- [Download and Cache Locations \(Basic MSI and InstallScript MSI Projects\)](#)
- [Debugging](#)
- [SMS Data](#)
- [Minimum UI](#)
- [Miscellaneous](#)

## Silent Installations

**Table 13** ▪ Parameters for Silent Installations

| Parameter           | Project Type                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/p"password"</b> | Basic MSI,<br>InstallScript<br>MSI     | <p>If you configured the password-related settings for your release on the <a href="#">Setup.exe tab in the Releases view</a>, the end user must specify the password with the /p option when running the installation silently. A typical command is as follows:</p> <pre>Setup.exe /s /p"password"</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>/r</b>           | InstallScript,<br>InstallScript<br>MSI | <p>Use this command line to run the installation in record mode.</p> <p>In order to run an InstallScript MSI or InstallScript installation in silent mode, you must first run Setup.exe with the /r option to generate a response file, which stores information about the data entered and options selected by the user at run time.</p> <p>Launching an InstallScript MSI or InstallScript installation with the /r parameter displays all the run-time dialogs and stores the data in a file called <a href="#">Setup.iss</a>, created inside the system's Windows folder. To specify an alternative response file name and location, use the /f1 option, described below.</p> <p>Basic MSI projects do not create or use a response file for silent installations.</p> |

Table 13 ■ Parameters for Silent Installations (cont.)

| Parameter | Project Type                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| /s        | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI | <p>For an InstallScript MSI or InstallScript project, the command Setup.exe /s runs the installation in silent mode, by default based on the responses contained in a response file called Setup.iss in the same directory. (Response files are created by running Setup.exe with the /r option.) To specify an alternative file name or location of the response file, use the /f1 option.</p> <p>The command Setup.exe /s also suppresses the Setup.exe initialization dialog for a Basic MSI installation, but it does not read a response file. To run a Basic MSI installation silently, use the following command line:</p> <pre>Setup.exe /s /v/qn</pre> <p>To specify the values of public properties for a silent Basic MSI installation, you can use a command such as the following one:</p> <pre>Setup.exe /s /v"/qn INSTALLDIR=D:\Destination"</pre> <div></div> <p><b>Note</b> ■ Using this command-line parameter to launch an installation that includes an InstallShield prerequisite does not automatically run the prerequisite installation silently. You may also need to specify a valid silent command-line parameter for the InstallShield prerequisite in the <b>Specify the command line for the application when the setup is running in silent mode</b> setting on the <a href="#">Application to Run</a> tab in the InstallShield Prerequisite Editor.</p> <p>For more information, see <a href="#">Specifying Command-Line Parameters for an InstallShield Prerequisite</a>.</p> |
| /f1       | InstallScript,<br>InstallScript<br>MSI               | <p>Using the /f1 option enables you to specify where the response file is (or where it should be created) and what its name is, as in the following example:</p> <pre>Setup.exe /s /f1"C:\Temp\Setup.iss"</pre> <p>Specify an absolute path; using a relative path gives unpredictable results. The /f1 option is available both when creating a response file (with the /r option) and when using a response file (with the /s option).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 13** • Parameters for Silent Installations (cont.)

| Parameter  | Project Type                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/f2</b> | InstallScript,<br>InstallScript<br>MSI | <p>When running an InstallScript MSI or InstallScript installation in silent mode (using the <code>/s</code> option), the log file <b>Setup.log</b> is by default created in the same directory and with the same name (except for the extension) as the response file. The <code>/f2</code> option enables you to specify an alternative log file location and file name, as in the following example:</p> <pre>Setup.exe /s /f2"C:\Setup.log"</pre> <p>Specify an absolute path; using a relative path gives unpredictable results.</p> |

Special Installation Modes

Table 14 • Parameters for Special Installation Modes

| Parameter | Project Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/a</b> | Basic MSI,<br>InstallScript<br>MSI | <br><b>Note</b> ▪ The <i>/a</i> parameter does not work with <i>Update.exe</i> . <i>Update.exe</i> launches a patch that accesses and modifies an existing cached .msi file on the system, and an administrative installation does not cache the .msi file.<br><br>The <i>/a</i> option causes <i>Setup.exe</i> to perform an administrative installation. An administrative installation copies (and uncompresses) your data files to a directory that is specified by the user, but it does not create shortcuts, register COM servers, or create an uninstallation log. |
|           |                                    | <br><b>Tip</b> ▪ If an installation contains <i>InstallShield prerequisites</i> and you want to extract them from <i>Setup.exe</i> , add a path after the <i>/a</i> parameter to extract the prerequisites to that location. A sample command is <i>Setup.exe /a"C:\temp"</i> .                                                                                                                                                                                                                                                                                            |
| <b>/j</b> | Basic MSI,<br>InstallScript<br>MSI | The <i>/j</i> option causes <i>Setup.exe</i> to perform an advertised installation. An advertised installation creates shortcuts, registers COM servers, and registers file types, but does not install your product's files until the user invokes one of these "entry points."                                                                                                                                                                                                                                                                                                                                                                            |
| <b>/x</b> | Basic MSI,<br>InstallScript<br>MSI | The <i>/x</i> option causes <i>Setup.exe</i> to uninstall a previously installed product.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 14** • Parameters for Special Installation Modes (cont.)

| Parameter          | Project Type                                                                                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/uninst</b>     | InstallScript, InstallScript MSI (if the InstallScript user interface (UI) style is the traditional style, which uses the InstallScript engine as an external UI handler) | <div>  <p><b>Important</b> • This parameter does not apply to InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler). To learn more, see <a href="#">Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations</a>.</p> <p>The /uninst option is provided for compatibility with earlier versions of InstallShield. This option causes the InstallScript engine to execute the event handler function OnUninstall, whose default code uninstalls the previously installed product.</p> </div> <div>  <p><b>Project</b> • Note that in InstallScript MSI installations, the /uninst parameter does not invoke the InstallScript engine uninstall behavior that processes install log and removes any resources that were created and logged through script. However, the /removeonly option does invoke this behavior.</p> </div> |
| <b>/removeonly</b> | InstallScript, InstallScript MSI                                                                                                                                          | The /removeonly option sets the REMOVEONLY system variable equal to a non-zero value. The default code for the OnMaintUIBefore event handler function conditionally displays the <b>SdWelcomeMaint</b> dialog, depending on the value of REMOVEONLY.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 14 • Parameters for Special Installation Modes (cont.)

| Parameter                                 | Project Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>/instance=&lt;InstanceId&gt;</code> | Basic MSI    | <p>The <code>/instance=&lt;InstanceId&gt;</code> option—which is available for <a href="#">Basic MSI projects that support the installation of multiple instances of a product</a>—lets you specify which instance you want to install, update, or uninstall. <code>&lt;InstanceId&gt;</code> represents the value of the <code>InstanceId</code> property that identifies the instance. Whenever you use this option and include a valid <code>InstanceId</code> value, the installation suppresses the instance selection dialog.</p> <p>For example, the following sample command line installs the instance that has 2 as the value of the <code>InstanceId</code> property:</p> <pre>Setup.exe /instance=2</pre> <p>Use <i>default</i> to identify the instance that is installed by the base installation package, as in the following example:</p> <pre>Setup.exe /instance=default</pre> <p>To specify the instance that you want to uninstall, include the <code>/x</code> option with the <code>/instance=&lt;InstanceId&gt;</code> option.</p> <p>For more information, see <a href="#">Naming an Instance</a> and <a href="#">Run-Time Behavior for Installing Multiple Instances of a Product</a>.</p> |

## Passing Data to the Installation

**Table 15** ■ Parameters for Passing Data to the Installation

| Parameter                                                           | Project Type                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>/v</code>                                                     | Basic MSI, InstallScript MSI                              | <p>Use the <code>/v</code> option to pass command-line options and values of public properties through to <code>Msiexec.exe</code>.</p> <p>If you want to pass more than one argument to <code>Msiexec.exe</code>, you can use the <code>/v</code> option multiple times at the command line, once for each argument. For example:</p> <pre>Setup.exe /v"/1*v c:\test.log" / v"MYPROPERTY1=value1" /v"/qb"</pre> <p>As an alternative, you can pass multiple arguments through the <code>/v</code> option as in the following example:</p> <pre>Setup.exe /v"/1*v c:\test.log MYPROPERTY1=value1 /qb"</pre> <div>  <p><b>Note</b> ■ If you pass the <code>/v</code> parameter at the command prompt when launching <code>Setup.exe</code>, any parameters that are specified for the <code>CmdLine</code> keyname in <code>Setup.ini</code> are ignored. To learn more, see <a href="#">Setup.ini</a>.</p> </div> |
| <code>/v"ISSCRIPTCMDLINE=\"&lt;Option1&gt;&lt;Option2&gt;\""</code> | Basic MSI projects that have InstallScript custom actions | <p>This option specifies command-line parameters to be passed to the script. Any property supported by InstallScript MSI (where appropriate) can be specified. (The most common ones are <code>/d</code> and <code>/z</code>.)</p> <p>For example, the following indicates that you want to debug the script, and that the <code>CMDLINE</code> variable should contain <code>TEST</code>.</p> <pre>Setup.exe /v"ISSCRIPTCMDLINE=\"-d -zTEST\""</pre> <p>Note that as shown above, when you want to specify that a double quote character is not a delimiter for the command line but a delimiter for the property, use <code>\</code>.</p> <p>Note also that as with any public Windows Installer property, this property should be specified with all uppercase letters.</p>                                                                                                                                                                                                                     |

**Table 15** ▪ Parameters for Passing Data to the Installation (cont.)

| Parameter | Project Type         | Description                                                                                                                                                                                                                                                                                                  |
|-----------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/z</b> | InstallScript<br>MSI | <p>The <code>/z</code> option is used to pass data to the InstallScript system variable <code>CMDLINE</code>, as in the following example:</p> <p>Setup.exe /z"My Custom Data"</p> <p>When this command line is used, the variable <code>CMDLINE</code> contains the string <code>My Custom Data</code>.</p> |

## Download and Cache Locations (Basic MSI and InstallScript MSI Projects)

**Table 16** - Parameters for Download and Cache Locations

| Parameter                | Project Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/ua</b><br><b>/uw</b> | Basic MSI,<br>InstallScript<br>MSI | <p>In the Release Wizard, you can specify download locations for the Windows Installer installers InstMsiA.exe and InstMsiW.exe. A user can specify an alternative URL at run time using the /ua option (for the InstMsiA.exe location) and /uw option (for the InstMsiW.exe location), as in the following example:</p> <pre>Setup.exe /uw"http://www.otherlocation.com/engines"</pre> <p>The file name is not necessary.</p>  <p><b>Note</b> - You must specify the full URL with the parameters.</p> |
| <b>/um</b>               | Basic MSI,<br>InstallScript<br>MSI | <p>In the Release Wizard, for a Web Downloader build, you can specify a <b>download location</b> for your .msi database. A user can specify an alternative URL using the /um option, as in the following example:</p> <pre>Setup.exe /um"http://www.otherlocation.com/packages/product.msi"</pre>  <p><b>Note</b> - You must specify the full URL with the parameter.</p>                                                                                                                             |
| <b>/b</b>                | Basic MSI,<br>InstallScript<br>MSI | <p>In the Release Wizard, for a Downloader build, you can specify whether to cache the contents of a compressed package on the local system. With the /b option, the user can specify the directory in which to cache the installation files, as in the following example:</p> <pre>Setup.exe /b"C:\CacheDirectory"</pre>  <p><b>Note</b> - You must specify the full URL with the parameter.</p>                                                                                                     |

Debugging

Table 17 ▪ Parameters for Debugging

| Parameter | Project Type                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| /d        | Basic MSI projects with InstallScript custom actions, InstallScript, InstallScript MSI | <p>For an InstallScript project, running the command Setup.exe /d runs the installation program with the InstallScript Debugger.</p> <div></div> <p><b>Note ▪</b> Debugging InstallScript code requires the debug-information file Setup.dbg to be available. In addition, in order to debug an installation on a system other than your development machine, you need to copy certain files from your development machine to the debugging machine. To learn more, see Debugging an Installation on Any Computer.</p> <p>For a Basic MSI project, the following command runs your InstallScript custom actions in the InstallScript Debugger:</p> <pre>Setup.exe /v"ISSCRIPTDEBUG=1 ISSCRIPTDEBUGPATH=\"path-to-Setup.dbg\""</pre> |

**Table 17** ■ Parameters for Debugging (cont.)

| Parameter        | Project Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/debuglog</b> | Basic MSI,<br>InstallScript<br>MSI | <p>The /debuglog parameter lets you generate a log file for Setup.exe.</p> <p>To generate a log named InstallShield.log in the same directory as the Setup.exe file, pass just the command-line parameter. Note that this does not work if the Setup.exe file is in a read-only location. For example:</p> <pre>setup.exe /debuglog</pre> <p>To specify the name and location of the log file, pass the path and name, as in the following example:</p> <pre>Setup.exe /debuglog"C:\PathToLog\setupexe.log"</pre> <p>To generate a log file for the feature prerequisites in the installation, use the /v parameter to set the ISDEBUGLOG property to the full path and file name for the log file, as follows:</p> <pre>Setup.exe /debuglog"C:\PathToSetupLogFile\setup.log" /v"ISDEBUGLOG=prereq.log"</pre> <p>You can use directory properties and environment variables in the path for the feature prerequisite log file.</p> <p>Additionally, use the option /newlog with the /debuglog parameter or set the <b>Always Create Debug Log</b> option to Yes in the IDE setting to overwrite the existing debug log and create the log(s) newly.</p> <p>To overwrite the existing log named InstallShield.log in the same directory as the Setup.exe file, pass just the command-line parameter. For example, setup.exe /debuglog /newlog.</p> <p>To specify the name and location of the existing log file to overwrite, pass the path and name, as in the following example:</p> <pre>setup.exe /debuglog"C:\PathToLog\setupexe.log" /newlog</pre> <div>  <p><b>Note</b> ■ The message “The setup command line is invalid. The Setup cannot proceed” will be shown when /newlog option was not used with /debuglog parameter or the <b>Always Create Debug Log</b> option is not set to Yes.</p> </div> |

## SMS Data

**Table 18** - Parameters for SMS Data

| Parameter  | Project Type                           | Description                                                                                                                                                                                                                         |
|------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/m</b>  | InstallScript,<br>InstallScript<br>MSI | <p>The /m option causes Setup.exe to generate an SMS Management Information Format (.mif) file. Following is a typical command:</p> <pre>Setup.exe /m"SampleApp"</pre> <p>Including the ".mif" file extension is not necessary.</p> |
| <b>/m1</b> | InstallScript,<br>InstallScript<br>MSI | <p>Using the /m1 parameter (along with /m) enables you to specify a serial number to be written to the .mif file. A typical command is as follows:</p> <pre>Setup.exe /m"SampleApp" /m1"1234-5678"</pre>                            |
| <b>/m2</b> | InstallScript,<br>InstallScript<br>MSI | <p>Using the /m2 parameter (along with /m) enables you to specify a locale string to be written to the .mif file. A typical command is as follows:</p> <pre>Setup.exe /m"SampleApp" /m2"ENU"</pre>                                  |

## Minimum UI

**Table 19** - Parameters for Minimum UI

| Parameter       | Project Type                          | Description                                                                                                                                                                                                                                                            |
|-----------------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/passive</b> | Advanced<br>UI, Suite/<br>Advanced UI | <p>Use the /passive parameter to runs a suite installer setup in a minimum UI mode (just displaying a progress panel):</p> <pre>Setup.exe /passive</pre> <p>To uninstall using a minimum UI mode, use the following command:</p> <pre>Setup.exe /passive /remove</pre> |

## Miscellaneous

**Table 20** ■ Parameters for Miscellaneous

| Parameter                                      | Project Type                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------|----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/delayedstart:&lt;number of seconds&gt;</b> | InstallScript                                                  | <p>Specifies the amount of time (in seconds) by which initialization of the installation is delayed after Setup.exe is launched.</p>  <p><b>Note</b> ■ Using the <i>-delayedstart</i> option is recommended when manually launching an additional installation after reboot (for example, by using the <i>RunOnce</i> key). The delay allows the operation system to initialize completely; this prevents the problems—such as <i>Remote Procedure Call (RPC)</i> errors—that can occur if an installation initializes before the operating system has initialized completely. The recommended delay length is 30 seconds.</p> <p>Note that this option is not needed when the installation starts automatically after reboot (for example, due to a call to <b>SdFinishReboot</b> before reboot).</p> |
| <b>/runfromtemp</b>                            | Basic MSI, InstallScript, InstallScript MSI                    | <p>This parameter allows the setup author to always clone the setup and run it from the temporary directory, even if the setup does not meet the conditions for running from the temporary directory. This parameter is ignored if the setup is a self-extracting executable file (.exe).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>/Clone_wait</b>                             | InstallScript, Basic MSI, InstallScript MSI, Suite/Advanced UI | <p>This parameter indicates that the original setup should wait for the cloned setup process to complete before exiting.</p> <p>By default, the original setup is enabled to wait for the completion of the installation process.</p> <p>For more information on <i>Clone_wait</i>, see <a href="#">Changing the Default Clone_wait Parameter for the Setup</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>/extract_all:&lt;path&gt;</b>               | InstallScript                                                  | <p>Specifies that a self-extracting package's files should not be run but simply extracted to the location that is specified by &lt;path&gt;. A typical command is as follows:</p> <pre>Setup.exe /extract_all:"C:/ProductName Setup Files"</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 20** - Parameters for Miscellaneous (cont.)

| Parameter | Project Type                       | Description                                                                                                                                                                                                                                                                                           |
|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| /h        | Basic MSI,<br>InstallScript<br>MSI | The build engine automatically creates an installation that supports Setup.exe cloning in cases where cloning is required (for example, multi-disk installations). If you need to do this manually, pass /h to Setup.exe and it will clone itself to a temporary location and run from that location. |

**Table 20** ■ Parameters for Miscellaneous (cont.)

| Parameter             | Project Type                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/hide_progress</b> | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI | <p>Suppresses the display of any small and standard progress dialogs that might be shown during initialization.</p> <p>The small progress dialog is usually used for installations that display a splash screen during initialization, since a standard-size progress dialog does not leave any space for the splash screen. Specifying the /hide_progress option hides the small progress dialog for those installations, so end users would see just the splash screen without any progress indication.</p> <p></p> <p><b>Note</b> ■ For InstallScript installations: If you specify /hide_progress and include a splash screen in your InstallScript installation, the length of time that the splash screen is displayed depends on whether <b>SmallProgress=Y</b> or <b>SmallProgress=N</b> is specified in Setup.ini.</p> <ul style="list-style-type: none"> <li>● If <b>SmallProgress=Y</b> is specified, the splash screen is shown for as long as the progress dialog would have been displayed if /hide_progress was not specified.</li> <li>● If <b>SmallProgress=N</b> is specified, the splash screen is shown for the length of time specified in the <b>SplashTime</b> key; thus, using /hide_progress and <b>SmallProgress=Y</b> at the same time is not recommended.</li> </ul> <p>For InstallScript MSI installations: If you include a splash screen, the installation automatically switches to the small progress dialog, and the splash screen is shown only during the time that the progress dialog is displayed. Note that this is true even if /hide_progress is specified. Therefore, it is recommended that you avoid using /hide_progress with a splash screen in InstallScript MSI installations.</p> |
| <b>/hide_splash</b>   | InstallScript,<br>InstallScript<br>MSI               | Suppresses the display of the splash screen if one is included.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 20** • Parameters for Miscellaneous (cont.)

| Parameter                                | Project Type  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/hide_usd</b>                         | InstallScript | Suppresses display of the dialog that is displayed by an update-enabled installation to let the end user select which instance of your product will be updated. This dialog is displayed by default when an update-enabled installation detects multiple previous instances. When this command-line option is used and an update-enabled installation detects multiple previous instances, the installation creates a new instance.                                                                                                                                                                                                                                                              |
| <b>/ig{InstanceGUID}</b>                 | InstallScript | Specifies the value of the system variable INSTANCE_GUID; for example, -ig{722C7440-B317-4B3B-AECA-0199EA4E7CDB}. If this option is not used, the installation automatically assigns a value to INSTANCE_GUID (for multi-instance installations, this value is a newly generated GUID; for standard installations, this value is the same as the value of PRODUCT_GUID). This option is useful if you have created an installation launcher—that is, a custom application that runs before your installation does to perform pre-setup tasks, such as determining the instance GUID that you want to use for the installation. Do not specify anything other than a valid GUID with this option. |
| <b>/installfromweb"PathToDisk1Files"</b> | InstallScript | This option is similar to the media_path option except that this option forces the installation to behave like a launched One-Click Install installation, even if the path to the media files is not a URL. Use this option if you are launching the installation from a Web page manually. In addition, this option is added automatically if the built-in Setup.ocx file is used to launch the installation.                                                                                                                                                                                                                                                                                   |

**Table 20** ■ Parameters for Miscellaneous (cont.)

| Parameter                            | Project Type                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/media_path"PathToDisk1Files"</b> | InstallScript                                                               | This option indicates that the installation should look for the Disk1 files in the location that is specified. Note that only the Setup.exe file needs to be in the original launch location; the installation obtains all other required files from the specified location (including Setup.exe, which must be present in the media location). You can specify a URL as the path to the media files; in this case, the installation behaves like a launched One-Click Install installation, which always shows the security dialog. To learn more about the behavior of One-Click Install installations, see <a href="#">One-Click Install Installations in InstallScript Projects</a> .      |
| <b>/L&lt;LanguageID&gt;</b>          | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI                        | <p>This option indicates that the installation should run in the specified language as specified. You can specify the language ID as either a hexadecimal or decimal number. If you specify the hexadecimal number, be sure to precede the value with 0x. For example, the following commands indicate that the installation should be run in German:</p> <pre>Setup.exe -L0x0407 Setup.exe -L1031</pre> <p>Note that if you specify a language ID that is not supported by the installation or you specify an invalid language ID, the parameter is ignored. Also note that if this parameter is specified and it is valid, the language dialog (if enabled) is automatically suppressed.</p> |
| <b>/tempextractpath</b>              | Basic MSI,<br>InstallScript,<br>InstallScript<br>MSI, Suite/<br>Advanced UI | <p>This parameter allows you to customize the %TEMP% directory—which by default contains all executable files—to the desired location. A typical command is as follows:</p> <pre>Setup.exe /tempextractpath"C:\IS_temp\"</pre> <div>  <p><b>Note</b> ■ Using this parameter is recommended when an environment restriction, such as an antivirus, restricts an application for running executables from the %TEMP% directory.</p> </div>                                                                                                                                                                    |

Table 20 ■ Parameters for Miscellaneous (cont.)

| Parameter   | Project Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/w</b>   | Basic MSI,<br>InstallScript<br>MSI | <p>For a Basic MSI project, the /w option forces Setup.exe to wait until the installation is complete before exiting.</p> <div></div> <p><b>Note</b> ■ If you are using the /w option in a batch file, you may want to precede the entire Setup.exe command-line option with start /WAIT. A properly formatted example of this usage is as follows:</p> <pre>start /WAIT setup.exe /w</pre> |
| <b>/SMS</b> | InstallScript<br>MSI               | <p>For an InstallScript MSI project, Setup.exe automatically waits for the installation to finish before exiting, so this option (used by earlier versions of InstallShield Professional) is no longer necessary.</p>                                                                                                                                                                                                                                                        |

## User-Defined Command-Line Parameters

**Project** ■ This information about user-defined command-line parameters applies to InstallScript projects.

For user-defined command-line parameters in InstallScript MSI projects, use the -z command-line parameter that is described above.

Along with the command-line parameters that are listed above, -bd, -f, and -zi are command-line parameters that are reserved for use in InstallScript projects. User redefinition of these command-line parameters, either uppercase or lowercase, can cause errors.

You can define your own command-line arguments, which are copied to the system variable CMDLINE as at run time. Like predefined command-line parameters, you can pass custom arguments directly to Setup.exe, place them in Setup.ini, or (for testing purposes while you are using the InstallShield IDE) place them in the Settings dialog box, which is displayed when you click Settings on the Build menu in InstallShield.

When using user-defined command-line parameters in conjunction with built-in command-line parameters, ensure that the user-defined parameters are specified at the end of the entire command. Placing user-defined command-line parameters before or between built-in command-line parameters may result to incorrect execution or unexpected behavior. The following demonstrate the correct usage of the user-defined command-line parameters with the built-in command-line parameters

```
Setup.exe /f1"C:\Temp\Setup.iss" "User"Name; CompanyName;"
```

In this example, the user-defined parameters 'User"Name; CompanyName;' appear at the end of the command, following the /f1 built-in command-line parameter.

---

**Note** ▪ Setup.exe initializes correctly even on systems with more than 256 MB of memory and always stays in memory until the setup is complete. Due to the nature of DOS, when you launch Setup.exe from the command line, a DOS prompt is quickly returned although Setup.exe is still in memory.

## Advanced UI and Suite/Advanced UI Setup.exe Command-Line Parameters

---

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

---

**Edition** ▪ The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The Setup.exe setup launcher for Advanced UI and Suite/Advanced UI installations can accept a number of command-line parameters. Note that passing undefined parameters or invalid property definitions results in an invalid command-line error.

**Table 21** ▪ Parameters for Advanced UI and Suite/Advanced UI Setup Launchers

| Parameter                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/d</b><br><b>/d"PathTo.dbgFile"</b>          | <p>The /d parameter lets you debug the InstallScript actions in your Suite/Advanced UI installation with the InstallScript Debugger.</p> <div></div> <p><b>Note</b> ▪ <i>Debugging InstallScript code requires the debug-information file Setup.dbg to be available. In addition, in order to debug an installation on a system other than your development machine, you need to copy certain files from your development machine to the debugging machine. To learn more, see <a href="#">Debugging an Installation on Any Computer</a>.</i></p> <p>The following command runs your InstallScript custom actions in the InstallScript Debugger:</p> <pre>Setup.exe /d</pre> <p>If the installation is located in a path at which they were originally compiled, you also need to specify the path to your debug symbols file (.dbg):</p> <pre>Setup.exe /d"Path-to-Setup.dbg"</pre> <p>For more information about InstallScript actions in Suite/Advanced UI projects, see <a href="#">Working with an Action that Runs InstallScript Code in a Suite/Advanced UI Installation</a>.</p> <p>For more information on debugging issues, see <a href="#">Troubleshooting Issues with an Advanced UI or Suite/Advanced UI Installation</a>.</p> |
| <b>/debuglog</b><br><b>/debuglog"PathToLog"</b> | <p>The /debuglog parameter lets you generate a log file for Setup.exe.</p> <p>To generate a log named InstallShield.log in the same directory as the Setup.exe file, pass just the command-line parameter. Note that this does not work if the Setup.exe file is in a read-only location. For example:</p> <pre>Setup.exe /debuglog</pre> <p>To specify the name and location of the log file, pass the path and name, as in the following example:</p> <pre>Setup.exe /debuglog"C:\PathToLog\setupexe.log"</pre> <p>For more information, see <a href="#">Troubleshooting Issues with an Advanced UI or Suite/Advanced UI Installation</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 21** • Parameters for Advanced UI and Suite/Advanced UI Setup Launchers (cont.)

| Parameter                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/language:LCID</b>                                                          | <p>The <code>/language</code> parameter indicates that the installation should run in the specified language as specified. Specify the language ID as a decimal number. For example, to indicate that the installation should be run in German, pass the language ID as follows:</p> <pre>Setup.exe /language:1031</pre> <p>Note that if you specify a language ID that is not supported by the installation or you specify an invalid language ID, the parameter is ignored. Also note that if this parameter is specified and it is valid, the language wizard page (if enabled) is automatically suppressed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>/log</b><br><b>/log"PathToPackageLog"</b><br><b>/log:"PathToPackageLog"</b> | <p>The <code>/log</code> parameter lets you generate a log file for each package in the Advanced UI or Suite/Advanced UI installation for which logging is enabled.</p> <p>To generate package log files in a particular folder, pass the folder path with the <code>/log</code> parameter to the Advanced UI or Suite/Advanced UI Setup.exe file. You can optionally separate the <code>/log</code> parameter and the path with a colon. For example, both of the following command lines generate a log file in the PathToLogFiles folder:</p> <pre>Setup.exe /log"C:\PathToLogFiles"</pre> <pre>Setup.exe /log:"C:\PathToLogFiles"</pre> <p>Note that the path to the log file location must already exist.</p> <p>To generate package log files in the %TEMP% directory, leave out the path. For example:</p> <pre>Setup.exe /log</pre> <p>Note that logging must be enabled for a package, and the package's logging-related settings (which vary, depending on whether the package is an .msi package, an .msp package, some other type of package) must be configured in the Packages view. For more information, see <a href="#">Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation</a>.</p> |
| <b>/password:MyPassword</b>                                                    | <p>If you configured the password-related settings for your release on the <a href="#">Setup.exe tab in the Releases view</a>, the end user must specify the password with the <code>/password</code> parameter at run time during a silent installation. A typical command is as follows:</p> <pre>Setup.exe /silent /password:MyPassword</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 21** • Parameters for Advanced UI and Suite/Advanced UI Setup Launchers (cont.)

| Parameter                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PropertyName=Value</b><br><b>/PropertyName=Value</b><br><b>PropertyName=</b> | <p>You can pass properties to the Advanced UI or Suite/Advanced UI installation in more than one way. Following are examples:</p> <p>Setup.exe MyPropertyName=MyPropertyValue</p> <p>Setup.exe /MyPropertyName:MyPropertyValue</p> <p>To clear the value of a property, even if it is set by the Advanced UI or Suite/Advanced UI Setup.xml file, use the following syntax:</p> <p>Setup.exe MyPropertyName=</p> <p>The following properties have special meaning to the Advanced UI or Suite/Advanced UI installation when they are passed on the command line:</p> <ul style="list-style-type: none"> <li>● <b>ISFeatureInstall</b>—This property provides a comma-delimited list of feature names that are to be installed with the current installation operation. It is intended for a silent first-time installation.</li> <li>● <b>ISFeatureRemove</b>—This property provides a comma-delimited list of feature names that are to be removed with the current installation operation. It is intended for maintenance installations.</li> </ul> <p>For more information, see <a href="#">Advanced UI and Suite/Advanced UI Property Reference</a>.</p> |
| <b>/remove</b>                                                                  | The /remove parameter uninstalls the packages that are currently installed on the target system and that were installed by the Advanced UI or Suite/Advanced UI installation. This option also removes the Advanced UI or Suite/Advanced UI installation's entry in Add or Remove Programs if the maintenance condition in the Advanced UI or Suite/Advanced UI Setup.xml file is false.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>/repair</b>                                                                  | The /repair parameter repairs the packages that are currently on the target system and that were installed by the Advanced UI or Suite/Advanced UI installation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>/silent</b>                                                                  | The /silent parameter runs the installation without a user interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>/skipupdate</b>                                                              | <p>The /skipupdate parameter enables you to configure a Suite/Advanced UI silent installation—to instruct the installer to skip the download of any updates and proceed with a silent installation, instead of automatically forcing a user to apply the downloadable updates.</p> <p>This command-line parameter enhances a Suite/Advanced UI installation in silent mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 21** ■ Parameters for Advanced UI and Suite/Advanced UI Setup Launchers (cont.)

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/stage_only</b> | <p>The /stage_only parameter runs the staging part of the Advanced UI or Suite/Advanced UI installation, in which the Advanced UI or Suite/Advanced UI installation copies its packages to a directory that is specified by the user on the BrowseStageFolder wizard page.</p> <p>If any of the packages are compressed into the Advanced UI or Suite/Advanced UI Setup.exe file, the /stage_only option also extracts the packages from the Setup.exe file before copying them to the staging directory.</p> <p>In addition, if any of the packages are located on the Web, the /stage_only option downloads the packages and adds them to the staging directory.</p> <p>Note that this option does not run the packages in the Advanced UI or Suite/Advanced UI installation. Furthermore, it does not uncompress any of the packages. Thus, if you are creating a patch for an Advanced UI or Suite/Advanced UI installation and you need to generate an uncompressed .msi package for a package in your Advanced UI or Suite/Advanced UI installation, for example, use the stage-only option. Then perform an administrative installation for the .msi package.</p> <div data-bbox="626 940 670 989" data-label="Image"></div> <p><b>Tip</b> ■ The ISRootStagePath property stores the path to the folder that contains the copied files. To specify a default value for this property, set this property from the command line while passing the /stage_only parameter, as shown in the following example:</p> <pre>Setup.exe /stage_only ISRootStagePath="C:\MyStagingArea"</pre> |
| <b>/SuiteGUID</b>  | The /SuiteGUID parameter retrieves the Suite GUID from Setup.exe and the GUID saves into SuiteGUID.log file under Setup.exe location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>/Update</b>     | <p>The /Update parameter can be used to specify how to perform an update of a Suite/Advanced UI installation in silent mode.</p> <p>To install updates (if available) with no UI interaction and without displaying a progress bar, use:</p> <pre>setup.exe /silent /update</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

For information on how to specify command lines that you want an Advanced UI or Suite/Advanced UI installation to use when launching one of its packages, see [Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation](#).

# Setup.exe (InstallScript Projects)

---

**Project** ▪ This information applies to the InstallScript projects.

Setup.exe is the main installation executable file; it performs installation initialization and launches the installation engine to execute the installation on the target system.

When you create and build a release, Setup.exe and other setup engine redistributable files are placed in the Disk1 folder. You must ship these files on Disk1 of your distribution media.

---

**Note** ▪ You can rename Setup.exe to any valid file name, such as Install.exe. Note that for the installation to be launched by another installation using the DoInstall function, the launched installation's Setup.ini file must have the new file name in the [Startup] section's LauncherName key.

You can pass command-line options directly to Setup.exe, or you can place them in Setup.ini. For testing purposes, while you are using InstallShield, you can pass command-line options to Setup.exe through the Run/Debug tab of the Settings dialog box, which is displayed when you click Settings on the Build menu.

---

**Note** ▪ A self-extracting executable file accepts any command-line parameter that Setup.exe accepts.

For a list of supported parameters, see [Setup.exe and Update.exe Command-Line Parameters](#).

# Frequently Asked Questions

This section lists common questions (sorted by topic) and provides links to answers. Where the techniques or steps to perform a specific task are different in different project types, answers for each project type are displayed.

## Project Types

- [Which project type should I use?](#)
- [How do I convert my project to a different project type?](#)
  - [Why do I get “error C8025 ‘INSTALLDIR’: undefined identifier” when compiling my script after conversion?](#)
  - [Why do I get the following error: “String PRODUCT\\_NAME was not found in string table”?](#)

## Files and Folders

- [What is the difference between INSTALLDIR and TARGETDIR?](#)
- [How does Windows Installer determine whether to overwrite an existing file?](#)
- [How do I register a COM server?](#)
- [How do I install, start, stop, delete, uninstall, or configure a Windows service?](#)
- [How do I create an empty folder?](#)
- [How do I set a key file for a dynamic file link?](#)
- [What happens if I put more than one executable file in the same component?](#)

## Features and Components

- [How do I conditionally select a feature?](#)
- [How do I conditionally hide a feature?](#)
- [Why should I use uppercase directory identifiers when setting component destinations?](#)

- [How do I change the value in the Link To column for a component?](#)

## Redistributables

- [How do I add the Windows Installer to my project?](#)
- [How do I add the .NET Framework to my project?](#)

## Shortcuts

- [How do I create an Internet shortcut?](#)
- [How do I create a shortcut to a folder?](#)

## Registry

- [How do I read data from the registry?](#)
- [How do I write a property's value to the registry?](#)

## InstallScript

- [How do I find out what sort of built-in functions are available in the InstallScript language?](#)
- [What is the maximum number of statements that I can use in a compiled script file? What other limits exist for InstallScript?](#)

## INI Files

- [How do I read data from an .ini file?](#)
- [How do I get all key names from an .ini file?](#)

## Properties

- [How do I get or set a Windows Installer property in InstallScript?](#)
- [Why does my deferred custom action show a blank value for a Windows Installer property?](#)

## Conditions

- [How do I detect administrator privileges?](#)
- [How do I detect a first-time installation?](#)
- [How do I call a function only during the installation sequence?](#)
- [How do I detect if the user has selected a specific feature?](#)
- [How do I detect if the user is running a particular operating system?](#)

## End-User Interface

- [How do I populate a list box at run time?](#)
- [How do I display a file browse dialog?](#)
- [How do I display a network browse dialog?](#)

## Custom Actions

- How do I search for a file on the end user's system?
- How do I launch my application after the installation is complete?
- How do I place a file in the .msi database and extract it during run time?
- How do I exit the installation from within a custom action?
- How can I use the INSTALLDIR variable after I have created a custom action that runs VBScript code?
- How can I change ODBC properties (like DBQ and SystemDB) through script?

## SQL Scripts

- How do I override the default SQL run-time behavior?
- How can I control the execution of a SQL script based on certain conditions in an InstallScript project?
- How do I enforce a server-side installation in an InstallScript project?
- How do I enforce a SQL server-side installation in a Windows Installer-based project?
- How do I handle SQL run-time errors?
- How do I ensure that my SQL scripts run only against a full of SQL Server?

## Building Releases

- How do I build my release from the command line?
- How do I change project settings from the command line?

## Deployment

- How do users run my installation in silent mode?

## Uninstallation

- How do I remove files that were created by my product?
- How do I remove registry data created by my product?

Answers to many other questions are available in the [Knowledge Base](#).

# Glossary

**Table 1** • InstallShield Glossary

| Term                 | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>.bin file</b>     | A binary file that is executable on UNIX platforms. Application files usually have a .bin extension.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>.bmp file</b>     | A bitmap file of an image represented as an array of bits. In bitmap graphics, an image is displayed on the screen as a collection of tiny squares called pixels, which together form a pattern. Each pixel in the image corresponds with one or more bits.                                                                                                                                                                                                                                                                                                                 |
| <b>.cab file</b>     | See <a href="#">cabinet file</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>.command file</b> | A command file that is executable on Mac OS X platforms. Application files usually have a .command extension.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>.cub file</b>     | A validation module that stores and provides access to custom actions for internal consistency evaluators (ICEs). See also <a href="#">custom action</a> and <a href="#">internal consistency evaluator</a> .                                                                                                                                                                                                                                                                                                                                                               |
| <b>.exe file</b>     | An executable binary file on Windows platforms. Application files usually have an .exe file extension.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>.gif file</b>     | A graphics interchange format file supported on the Web. This type of file is in a bit-mapped graphics file format used for displaying bitmap images. These files use lossless compression, a method of compression in which no data is lost. This type of file supports up to 256 colors; it also supports transparency, where the background color can be set to transparent to let the color on the underlying page show through. This type of file format is more suitable than the .jpg file format for images with only a few distinct colors, such as line drawings. |
| <b>.idt file</b>     | An exported Windows Installer database table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>.ism file</b>     | The working file that InstallShield uses to store project information. When you build a release, InstallShield uses the .ism file to create an .msi file for distribution.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>.jar file</b>     | A Java archive file that contains the classes, images, and sound files for an installation, zipped up into a single file.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 1 • InstallShield Glossary

| Term                          | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>.jpg file</b>              | Also known as JPEG, which is the abbreviation for Joint Photographic Experts Group, the original name of the committee that wrote the standard. This type of file is one of the image file formats supported on the Web. The file uses lossy compression, a type of compression in which color and grayscale continuous-tone images are compressed and some data is lost to eliminate redundant or unnecessary information. These images support 16 million colors and are best suited for photographs and complex graphics. |
| <b>.mif file</b>              | A management information format file used to describe a hardware or software component.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>.msi file</b>              | The Windows Installer installation package in its finished state. It includes installation resource files and can have compressed within it all of the application's data files. The .msi file is the one that is distributed to the end users and will interact with the Windows Installer service to install your application on their machines.                                                                                                                                                                           |
| <b>.msm file</b>              | The database file of a merge module. This type of file contains all of the installation properties and installation logic for the module. See also <a href="#">merge module</a> .                                                                                                                                                                                                                                                                                                                                            |
| <b>.msp file</b>              | A Windows Installer patch file. This type of file consists of a summary information stream, transform substorages, and cabinet files. An .msp file contains at least one database transform that adds patching information to the database of its target installation package. The installer uses this patching information to apply the patch files that are stored in the cabinet files.                                                                                                                                   |
| <b>.mst file</b>              | A transform package. This type of file is a simplified Windows Installer database that contains the differences between two .msi databases. Transforms enable administrators to apply modified settings to a database when they are deploying an installation package. See also <a href="#">transform</a> .                                                                                                                                                                                                                  |
| <b>.NET</b>                   | An operating system platform that Microsoft created for connecting information, people, systems, and devices. The .NET environment enables developers to build, create, and deploy their applications and Web services using whatever languages they prefer via the common language run time.                                                                                                                                                                                                                                |
| <b>.NET Compact Framework</b> | A scaled-down version of the .NET Framework designed to run on resource-constrained devices, such as mobile devices. The .NET Compact Framework is currently available only for Pocket PC and Windows CE .NET devices, with support for more devices forthcoming.                                                                                                                                                                                                                                                            |
| <b>.NET Framework</b>         | A programming infrastructure that Microsoft created for building, deploying, and running applications and services that use .NET technologies such as Web services. The .NET Framework consists of three main parts: the common language run time, a hierarchical set of unified class libraries, and a componentized version of Active Server Pages called ASP.NET.                                                                                                                                                         |

Table 1 • InstallShield Glossary

| Term                                 | Definition                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>.ocx file</b>                     | An object linking and embedding (OLE) custom control file. This type of file is a cross-platform COM file that is called by an application to perform a function, such as the ability to resize windows.                                                                                                                            |
| <b>.p12 file</b>                     | A certificate file that conforms to public-key cryptography standard (PKCS) number 12, which specifies a portable format for securely storing or transporting a user's private keys, certificates, miscellaneous secrets, and other information.                                                                                    |
| <b>.pcp file</b>                     | A Windows Installer patch creation properties file.                                                                                                                                                                                                                                                                                 |
| <b>.prq file</b>                     | A prerequisite file that contains information about a base application or component that must be installed on the target machine before the main application can be installed. Including setup prerequisites in installation projects enables developers to chain multiple installer files together into a single executable file.  |
| <b>.reg file</b>                     | See <a href="#">registry file</a> .                                                                                                                                                                                                                                                                                                 |
| <b>.scm file</b>                     | A ScreenCam movie file.                                                                                                                                                                                                                                                                                                             |
| <b>.wmf file</b>                     | A Windows metafile format file. This type of graphics file is used to exchange graphics information between Microsoft Windows-based applications.                                                                                                                                                                                   |
| <b>absolute path</b>                 | An absolute path includes all of the information necessary to locate a file by starting at the root directory of a specified drive. For example, C:\Program Files\InstallShield is the absolute path to the InstallShield folder when it is installed on drive C.                                                                   |
| <b>accessibility</b>                 | The capacity or tendency to be available to all people, including those with disabilities.                                                                                                                                                                                                                                          |
| <b>acquisition phase</b>             | The phase of the installation process during which the installer queries the database for instructions. The acquisition phase is followed by the execution phase.                                                                                                                                                                   |
| <b>action</b>                        | A command that performs an operation at a particular point during the execution of an installation or uninstallation wizard. Developers of installation packages can use built-in standard actions and create their own custom actions. Actions may display progress to the end user or allow the end user to cancel the operation. |
| <b>active directory</b>              | A structure supported by Microsoft Windows 2000 that enables administrators to track and locate any object on a network. Active Directory is the directory service used in Windows 2000 Server for distributed computing environments.                                                                                              |
| <b>active template library (ATL)</b> | A set of classes for writing COM controls, resulting in smaller binaries than, for example, MFC.                                                                                                                                                                                                                                    |

Table 1 • InstallShield Glossary

| Term                               | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ActiveX</b>                     | A set of object-oriented programming technologies and tools. ActiveX enables developers to write applications so that other applications and the operating system can call them. ActiveX technology makes it possible to create interactive Web pages that look and behave like applications, rather than static pages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>administration</b>              | The act or process of managing something.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>administration sequence</b>     | The list of actions that are executed when a user launches your installation with the /a command-line option. This is useful for network administrators who want to provide a common installation point on the network and prepare different installation criteria for multiple users. Each Administration sequence consists of a User Interface sequence and an Execute sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>administrative installation</b> | Copies and uncompresses your data files to a directory specified by the user, but does not create shortcuts, register COM servers, or create an uninstallation log.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>administrative privileges</b>   | The highest level of permission that can be granted to a computer user. Levels of permissions are necessary in networked environments to ensure system security and prevent damage to computer hardware and software. A user with administrative privileges can perform tasks such as install and uninstall software and change a computer's configurations. Administrative privileges usually pertain to Windows NT 4.0, 2000, or XP machines as opposed to Windows 95, 98, or ME machines.                                                                                                                                                                                                                                                                                                                                                            |
| <b>advertised shortcut</b>         | A shortcut to a product or feature that is not installed until the first time that the end user launches the shortcut. At run time of an installation, if the end user selects the "This feature will be installed when required" option for the product or the feature containing the shortcut, the shortcut is created but the component's files are not installed until the end user launches the shortcut. The first time the shortcut is launched, the Windows Installer service installs the component's files and other data and then the shortcut launches the target file. Every time the shortcut is used from then on, it behaves like a normal shortcut.                                                                                                                                                                                    |
| <b>advertisement</b>               | A type of "just-in-time" installation in which features are not installed immediately during the installation process. Instead, they are installed on the fly when they are requested. When you enable feature advertisement, the feature is advertised, regardless of the mode in which the installation is running, as long as no other factors prevent it from being advertised. If you launch MsiExec.exe from the command line with the /jm option, the feature is advertised to the end user's machine. If you use the /ju function, the feature is advertised to the current end user. In the Custom Setup dialog, the end user can control which features are immediately installed and which are available later. The two types of advertising are assigning and publishing. See also <a href="#">assigning</a> ; <a href="#">publishing</a> . |
| <b>advertisement sequence</b>      | The advertisement sequence contains the list of actions that are executed when a user launches your installation with the /j command-line option. Validation rule ICE78 requires the advertisement user interface sequence to be empty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 1 • InstallShield Glossary

| Term                                                              | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>advertising</b>                                                | The process of presenting to end users features that are not installed immediately during the installation process. Instead, these features are installed on the fly when they are requested. See also <a href="#">advertisement</a> .                                                                                                                                                                                                                        |
| <b>AlwaysInstallElevated</b>                                      | A user policy that can be configured for Windows platforms under the following registry keys: HKEY_LOCAL_MACHINE\Software\Polices\Microsoft\Windows\Installer and HKEY_CURRENT_USER\Software\Polices\Microsoft\Windows\Installer. To install a package with elevated (system) privileges, set the AlwaysInstallElevated value under both of these registry keys to 1.                                                                                         |
| <b>American Standard Code for Information Interchange (ASCII)</b> | The code that represents letters, numbers, punctuation marks, and other characters such as numbers, with each character assigned a value between 0 to 127. This code enables different types of computers and computer applications to exchange data.                                                                                                                                                                                                         |
| <b>animation</b>                                                  | Multiple graphic images that are alternately changed and displayed at a specified number of frames per second to produce the illusion of movement.                                                                                                                                                                                                                                                                                                            |
| <b>API</b>                                                        | See <a href="#">application programming interface</a> .                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>app paths</b>                                                  | The registry key that Windows uses to find your application and its .dll files if their locations are not already in the system's path. App paths entries can be set through the component's advanced settings.                                                                                                                                                                                                                                               |
| <b>application programming interface (API)</b>                    | A set of routines that an application uses to communicate with the computer's operating system and that the operating system uses to make services available to the application.                                                                                                                                                                                                                                                                              |
| <b>ASCII</b>                                                      | See <a href="#">American Standard Code for Information Interchange</a> .                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>assigning</b>                                                  | A type of advertisement. If an administrator assigns an application to a machine, the installation program automatically runs the next time that the machine starts or restarts. If the administrator assigns an application to a user, the installation program places a shortcut on the Start menu of the user's machine. When the user selects the shortcut or launches a document associated with the assigned application, the application is installed. |
| <b>asynchronous execution</b>                                     | A custom action that independently continues with the execution of its thread while the installer executes the main installation.                                                                                                                                                                                                                                                                                                                             |
| <b>ATL</b>                                                        | See <a href="#">active template library</a> .                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>autonomic computing</b>                                        | A self-managed computing model named after, and patterned on, the human body's autonomic nervous system. An autonomic computing system would control the functioning of computer applications and systems without input from users, similar to the way that the human body's autonomic nervous system regulates and protects the body.                                                                                                                        |

| <b>auto-repair</b>  | The automatic restoring of an application to its original state by the installer. A partial or complete application reinstallation might be required if any files associated with any feature are missing or corrupted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>basic UI</b>     | One level of the installer's internal user interface (UI) capabilities. Typically, installation packages that are built with the basic UI level display built-in modeless dialog that show progress messages and disc prompt messages. They do not display any authored dialogs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>billboards</b>   | Images, such as marketing messages, that can be displayed during installation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Binary table</b> | A table that holds the binary data for items such as bitmaps and icons. It also contains data for custom actions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>bitmap</b>       | A representation of an image presented as an array of bits. In bitmap graphics, an image is displayed on the screen as a collection of tiny squares called pixels, which together form a pattern. Each pixel in the image corresponds with one or more bits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>cabinet file</b> | A single file that holds a number of compressed files. During installation of an application, the compressed files are decompressed and copied to your computer. Cabinet files are efficient because they save space and time when distributing software. A cabinet file usually has the file extension .cab. Missing or corrupt files may prevent installations from completing. It may be necessary to replace missing or corrupt operating system files or InstallShield files by extracting them from a cabinet file.                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>cache</b>        | A cache (pronounced <i>cash</i> ) is a temporary storage area for frequently accessed data. The purpose of caching is to store frequently used information in a location that is easy to access, resulting in a faster-running computer. There are two types of cache: memory cache and disc cache. Memory cache stores the data and the address of where the data is stored in main memory. Memory caching is useful because most applications access the same data repeatedly. Disc caching uses the main memory. It is used to hold information that has recently been requested from the hard disc or has previously been written to the hard disc. In general, installations usually use the disc cache. When data is read from or written to main memory, a copy is also saved in the memory cache. When data is called for, the computer first checks the memory cache, then the disc cache, and finally main memory. |
| <b>caption</b>      | A text heading in a window. The windows caption is what users click and drag to position the active window on the screen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>CBT</b>          | See <a href="#">computer-based training</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>CD</b>           | See <a href="#">compact disc</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Term                         | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CD browser</b>            | A graphical user interface that is launched when a CD is inserted in the drive. It is used to launch one or more applications on the CD.                                                                                                                                                                                                                                                                                                   |
| <b>CD-ROM</b>                | See <a href="#">compact disc read-only memory</a> .                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>checksum</b>              | A calculated figure that is applied to data to test for possible corruption. The checksum is derived by sequentially combining bytes of data in the file in a systematic manner. After transmission or storage compression, the checksum calculation is performed again and the result is compared with the previous outcome. If the numbers do not match, this indicates that there is likely an error in the stored or transmitted data. |
| <b>column</b>                | A vertical set of information.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>COM</b>                   | See <a href="#">component object model</a> .                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>COM file</b>              | Binary software components containing reusable code that can be shared across products. A popular example of a COM file is a Microsoft Excel spreadsheet when it is embedded in a Word document. In this example, Excel acts as the COM server and Word acts as the client.                                                                                                                                                                |
| <b>COM server</b>            | An executable file that exposes objects to other applications according to the Component Object Model (COM) specification. The types of objects exposed by a COM server may include ActiveX controls, ActiveX documents, Automation objects, or MTS components.                                                                                                                                                                            |
| <b>COM+ file</b>             | An extended COM file. With regard to installations, COM+ adds greater support for building distributed components. For example, you can create appID keys and values in the registry and thereby configure various COM components to run remotely or with special privileges.                                                                                                                                                              |
| <b>command</b>               | <p>(1) An instruction given to a computer.</p> <p>(2) An instruction that the operating system executes from the command line or a Command Prompt window to perform a specific task. If errors occur during installation, you may, for example, need to execute commands to run utilities, search your computer's directories, or delete files.</p>                                                                                        |
| <b>command line</b>          | The area of the Command Prompt window in which commands are typed. A command line is used to pass commands to executable files (for example, .exe, .bin).                                                                                                                                                                                                                                                                                  |
| <b>command prompt window</b> | The Command Prompt window is the interface to MS-DOS. To access the Command Prompt window, click Run on the Start menu, and then type <b>command.com</b> in Windows 95, 98, and ME or <b>cmd.exe</b> in Windows NT, 2000, or XP. If errors occur during installation, you may need to open the Command Prompt window to enter commands to run utilities or search your computer's directories, for example.                                |

| Term                                          | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>command-line option</b>                    | A command-line option is an argument to a command that changes how the command is executed. See also <a href="#">command</a> .                                                                                                                                                                                                                                                                                                                          |
| <b>commit execution</b>                       | Execution of a Windows Installer action upon completion of the InstallFinalize action, which occurs when the installation has completed transferring files, registering COM servers, and creating shortcuts and registry entries.                                                                                                                                                                                                                       |
| <b>committing databases</b>                   | Accumulated changes made in a Windows Installer database. The changes are not reflected in the actual database until the database is committed, that is, until <b>MsiDatabaseCommit</b> is called.                                                                                                                                                                                                                                                      |
| <b>compact disc (CD)</b>                      | A disc used for electronically recording, storing, and playing back audio, video, and other information in digital form.                                                                                                                                                                                                                                                                                                                                |
| <b>compact disc read-only memory (CD-ROM)</b> | A type of compact disc that is only readable.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>component</b>                              | Elements of the application from the installation developer's perspective. Components are not visible to the end user. When the end user selects a feature for installation, the installer determines which components are associated with that feature, and then those components are installed. Components of an application would contain, for example, the executable binary files, data files, shortcuts, help system files, and registry entries. |
| <b>component object model (COM)</b>           | A Microsoft-developed software architecture that enables the creation of component-based applications. Component-based applications allow other components and other applications to use their features, adding functionality to these programs.                                                                                                                                                                                                        |
| <b>compress</b>                               | Take one or more files and create a new file whose size is less than the total size of the original file(s) and from which the original file(s) can be re-created.                                                                                                                                                                                                                                                                                      |
| <b>computer-based training (CBT)</b>          | Any instruction delivered by computer. CBTs often use graphics, sound, animation, and interaction to train people.                                                                                                                                                                                                                                                                                                                                      |
| <b>condition</b>                              | A statement of logic that compares the value of a property to a fixed value or determines whether the property is defined. The condition must evaluate to true if the object, feature, component, action, or other item associated with the condition is to be installed or performed.                                                                                                                                                                  |
| <b>conditional installation</b>               | Installation of certain items only if certain conditions are met. For example, if an operating system condition is associated with the installation of an application, the application is installed on a target machine only if that target machine is running the specified operating system.                                                                                                                                                          |

**Table 1** - InstallShield Glossary

| Term                                     | Definition                                                                                                                                                                                                                                                                                      |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>consume</b>                           | What an installation does to a redistributable package such as a merge module or InstallShield object.                                                                                                                                                                                          |
| <b>context menu</b>                      | A context menu, also known as a right-click menu or a pop-up menu, opens when a user right-clicks an item on the desktop, in Windows Explorer, or in an application.                                                                                                                            |
| <b>converted project</b>                 | (1) A file that has been transformed from one type of file to another.<br><br>(2) The Open MSI/MSM Wizard in InstallShield is a tool that converts .msi files and merge module (.msm) files to InstallShield installation projects (.ism files) that you can modify and build in InstallShield. |
| <b>costing</b>                           | File costing is the process that InstallShield uses to determine the total disc space that a current installation requires.                                                                                                                                                                     |
| <b>custom action</b>                     | An action that is created by an installation author as opposed to a standard action that is built into a Windows installer. The action encapsulates a function performed during the installation, uninstallation, or maintenance of an application.                                             |
| <b>database</b>                          | A discrete collection of data in a database management system (DBMS).                                                                                                                                                                                                                           |
| <b>database function</b>                 | A function that operates on a database.                                                                                                                                                                                                                                                         |
| <b>database handle</b>                   | A quantity that specifies a database when a database function is called.                                                                                                                                                                                                                        |
| <b>database management system (DBMS)</b> | A set of applications that control the organization, storage, and retrieval of data for many users.                                                                                                                                                                                             |
| <b>DBMS</b>                              | See <a href="#">database management system</a> .                                                                                                                                                                                                                                                |
| <b>DCOM</b>                              | See <a href="#">distributed component object model</a> .                                                                                                                                                                                                                                        |
| <b>DCOM file</b>                         | Software components that are able to communicate across a network. DCOM, previously called network OLE, allows the components for a single application to be distributed across multiple networked computers.                                                                                   |
| <b>decompress</b>                        | The reverse process of compression, which minimizes the size of a file by removing its space characters. This process returns the file to its original state.                                                                                                                                   |
| <b>deferred execution</b>                | Execution of an installer action upon execution of the installation script.                                                                                                                                                                                                                     |
| <b>dependency</b>                        | A software object that is required by another software object.                                                                                                                                                                                                                                  |
| <b>dialog</b>                            | Windows of information that display to the end user during installation and uninstallation. They enable the end user to interact with the operation by reading or specifying information. See also <a href="#">wizard</a> .                                                                     |

Table 1 • InstallShield Glossary

| Term                                             | Definition                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dialog box</b>                                | A window that displays within an application interface that enables users to enter information or specify commands.                                                                                                                                                                                                        |
| <b>differential release</b>                      | A release that contains only those files that were absent from one or more of a specified set of existing releases. A differential release is used to update the versions of your product that were installed by those existing releases.                                                                                  |
| <b>digital signing</b>                           | To assure end users that the code within your application has not been tampered with or altered since publication, you can digitally sign your application. When you do so, end users are presented with a digital certificate when they download your product.                                                            |
| <b>distributed component object model (DCOM)</b> | An extension of the component object model (COM), a Microsoft-developed software architecture that enables the creation of component-based applications.                                                                                                                                                                   |
| <b>distribution media</b>                        | A CD-ROM or other format of media deployed to users.                                                                                                                                                                                                                                                                       |
| <b>DLL</b>                                       | See <a href="#">dynamic link library</a> .                                                                                                                                                                                                                                                                                 |
| <b>drag</b>                                      | The act of selecting an item and moving it to another location.                                                                                                                                                                                                                                                            |
| <b>dynamic link library (DLL)</b>                | A shared, code-base file containing functions that can be called from other applications.                                                                                                                                                                                                                                  |
| <b>edit field object</b>                         | An interactive object that lets the user enter text into a field.                                                                                                                                                                                                                                                          |
| <b>elevated privileges</b>                       | Privileges that are higher than standard privileges, and are usually temporarily. Privileges are permissions to perform certain actions on a system.                                                                                                                                                                       |
| <b>end user</b>                                  | The person who installs or uninstalls your product.                                                                                                                                                                                                                                                                        |
| <b>end user machine</b>                          | The machine onto which an end user installs or from which uninstalls your product.                                                                                                                                                                                                                                         |
| <b>engine</b>                                    | A program that performs essential functions and coordinates the overall operation of other programs. Engines work behind the scenes. InstallShield uses the InstallScript engine (ISScript.msi) and the Windows Installer engine to drive installations. InstallShield also has its own proprietary engine called ikernel. |
| <b>environment variable</b>                      | A variable that can be accessed by multiple programs on the target system.                                                                                                                                                                                                                                                 |
| <b>EXE media type</b>                            | All of the installation and uninstallation files that are contained in a single, self-extracting file.                                                                                                                                                                                                                     |
| <b>executable (.bin) file</b>                    | A file that contains a program that can run on UNIX platforms.                                                                                                                                                                                                                                                             |
| <b>executable (.exe) file</b>                    | A file that contains a program that can run on Windows platforms.                                                                                                                                                                                                                                                          |

Table 1 • InstallShield Glossary

| Term                                        | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>execution phase</b>                      | The phase during which an installer's actions are executed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>execution script</b>                     | Installer actions for a Windows Installer installation. The execution script is generated during the acquisition phase of installation and executed during the execution phase.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>expand</b>                               | <p>(1) To restore a compressed file to its original size. A compressed file is a single file that contains one or more other files, for example, a cabinet file. Compressed files are reduced in size, thus, saving space.</p> <p>(2) A DOS command used to restore compressed files. During an installation, missing or corrupted operating system files or InstallShield files may need to be expanded from a compressed file to enable the installation to complete.</p>                                                                                                |
| <b>extensible markup language (XML)</b>     | <p>(1) A programming language that is essentially a simplified version of standard generalized markup language (SGML). It enables developers to create customized tags to organize and deliver content efficiently.</p> <p>(2) The format of the output of MultiPlatform projects.</p> <p>(3) Windows-based projects created in InstallShield can be converted to XML so that they can be saved in source code control software.</p>                                                                                                                                       |
| <b>extensible stylesheet language (XSL)</b> | A language used to describe how XML information should be presented.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>external user interface</b>              | The user interface developed by the author of an installation package. It does not use the internal user interface capabilities that are available with the installer.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>extract</b>                              | To remove, or decompress, a file from a compressed file, such as a cabinet file. A compressed file is a single file that contains one or more other files. Compressed files are reduced in size, thus, saving space. To use a file that has been compressed, it must first be "pulled out" of the compressed file. A command-line utility called Extract.exe can be used to extract files. During installation, missing or corrupted operating system files or InstallShield files may need to be extracted from a compressed file to enable the installation to complete. |
| <b>false positive</b>                       | A false positive is something that gives the appearance of being true by a test, but in reality is not. Most cases of false positives are found in anti-virus software. For example, anti-virus software may claim that it has found a virus in an InstallShield file, but in fact, this is not the case; their virus definitions need to be updated.                                                                                                                                                                                                                      |
| <b>feature</b>                              | Logical representations of the functionality of the product. For example, an installation could consist of a database, the main application files, and the help system files. Database, Application, and Help System would all be features of the product. Although features are visible to the end user, the actual files that comprise the features are within the components of the features. See also <a href="#">component</a> .                                                                                                                                      |
| <b>file</b>                                 | An element of data storage in a file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 1 • InstallShield Glossary

| Term                                     | Definition                                                                                                                                                                                                                                                  |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>file extension</b>                    | The portion of a file name, following the final point, that indicates the kind of data stored in the file.                                                                                                                                                  |
| <b>InstallShield scripting run time</b>  | See <a href="#">IDriver.exe</a> .                                                                                                                                                                                                                           |
| <b>formatted</b>                         | When data has been divided or arranged for storage or display.                                                                                                                                                                                              |
| <b>full update</b>                       | An installation that installs an updated version of your product over an earlier version.                                                                                                                                                                   |
| <b>full user interface (UI)</b>          | One level of the installer's internal user interface (UI) capabilities. Installation packages that are built with the full UI level can display both the modal and modeless dialogs that have been included in the internal UI.                             |
| <b>gallery</b>                           | A collection of available resources that can be shared.                                                                                                                                                                                                     |
| <b>globally unique identifier (GUID)</b> | A long string of numbers created by InstallShield to uniquely identify your product from others. Enter string GUIDs throughout InstallShield in the following format: {XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX}.                                               |
| <b>GUI</b>                               | Graphical user interface.                                                                                                                                                                                                                                   |
| <b>GUID</b>                              | See <a href="#">globally unique identifier</a> .                                                                                                                                                                                                            |
| <b>hard drive</b>                        | The primary storage device on a computer. A hard drive contains disks on which data is read from and written to magnetically. The term "hard" differentiates the aluminum or glass disks used in a hard drive from floppy disks, which are made of plastic. |
| <b>hotfix</b>                            | A quick, important fix for a bug whose deployment cannot wait until the next release of the application. Most hotfixes are in the form of small patches and can be downloaded from the software vendor's Web site.                                          |
| <b>HTML</b>                              | See <a href="#">hypertext markup language</a> .                                                                                                                                                                                                             |
| <b>hypertext markup language (HTML)</b>  | A language used to create Web pages with hyperlinks and markup for text formatting.                                                                                                                                                                         |
| <b>IAT</b>                               | See <a href="#">import address table</a> .                                                                                                                                                                                                                  |
| <b>ICE</b>                               | See <a href="#">Internal Consistency Evaluator</a> .                                                                                                                                                                                                        |
| <b>IDE</b>                               | See <a href="#">interactive development environment</a> and <a href="#">integrated development environment</a> .                                                                                                                                            |

Table 1 • InstallShield Glossary

| Term                              | Definition                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IDriver.exe</b>                | The InstallShield scripting run-time engine. It is required on a computer to run some installations created with InstallShield. IDriver.exe is located in one or both of the following common file locations by default: C:\Program Files\Common Files\InstallShield\Driver\7\Intel 32 or C:\Program Files\Common Files\InstallShield\Driver\8\Intel 32. Some installation error messages may reference IDriver.exe. |
| <b>IE</b>                         | See <a href="#">Internet Explorer</a> .                                                                                                                                                                                                                                                                                                                                                                              |
| <b>ikernel.exe</b>                | The InstallShield engine. See also <a href="#">engine</a> .                                                                                                                                                                                                                                                                                                                                                          |
| <b>immediate execution</b>        | Installation phase terminology that generally refers to custom actions that are immediately executed when the installer builds the script in an InstallScript project.                                                                                                                                                                                                                                               |
| <b>import address table (IAT)</b> | The table used to import .dll files or executable files.                                                                                                                                                                                                                                                                                                                                                             |
| <b>indirect build</b>             | A full build that creates references to the payload files only. This means that at installation time, the payload must be in the same place where it was at build time. For example, if your payload is on a network server, then the installation looks for the payload on that same network server.                                                                                                                |
| <b>install level</b>              | A feature's install level partly determines whether it is selected by default for installation. That value is compared to the Windows Installer property INSTALLLEVEL to determine which features are selected for installation: if a feature's install level property is less than or equal to the value of the INSTALLLEVEL, the feature will be installed.                                                        |
| <b>installation</b>               | The transfer of a program and its constituent files, features, and components from source media to a target system. See also <a href="#">installation process</a> .                                                                                                                                                                                                                                                  |
| <b>installation package</b>       | One or more files that are used together to install or uninstall an application.                                                                                                                                                                                                                                                                                                                                     |
| <b>installation process</b>       | The entire process of installing the contents of a package or application onto a target computer. The installation process consists of the acquisition phase, the execution phase, and, if the installation attempt is not successful, rollback.                                                                                                                                                                     |
| <b>installation project</b>       | The entire collection of source files, dialogs, actions, and conditions that make up your installation and uninstallation while it is under construction.                                                                                                                                                                                                                                                            |
| <b>installation sequence</b>      | The sequence in which an applications files are installed, acitons are executed, and dialogs display at run time. The installation sequence runs by default when the installation is launched, for example, by double-clicking the installation launcher.                                                                                                                                                            |
| <b>installation type</b>          | A predefined group of features from which the end user can select to install or uninstall.                                                                                                                                                                                                                                                                                                                           |

Table 1 • InstallShield Glossary

| Term                                             | Definition                                                                                                                                                                                                                                       |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>installation-on-demand</b>                    | A Windows Installer capability that makes it possible to offer functionality to users and applications in the absence of the files themselves.                                                                                                   |
| <b>INSTALLDIR</b>                                | A system variable that specifies the root destination directory for an installation.                                                                                                                                                             |
| <b>installer</b>                                 | An installation and configuration service on a computer.                                                                                                                                                                                         |
| <b>installer database</b>                        | A database that contains all the necessary information for the installation of an application. It consists of many interrelated tables that together comprise a relational database of information necessary to install a group of applications. |
| <b>installer function</b>                        | The application programming interface called by an application to obtain installer services.                                                                                                                                                     |
| <b>installer package authoring tool</b>          | A third-party tool that lets users create installation packages.                                                                                                                                                                                 |
| <b>installer properties</b>                      | Variables that are used during the installation.                                                                                                                                                                                                 |
| <b>INSTALLLEVEL</b>                              | Initial level at which features are selected “ON” for installation by default.                                                                                                                                                                   |
| <b>integrated development environment (IDE)</b>  | A software program’s interface. Also referred to as an <a href="#">interactive development environment</a> .                                                                                                                                     |
| <b>interactive development environment (IDE)</b> | A software program’s interface. Also referred to as an <a href="#">integrated development environment</a> .                                                                                                                                      |
| <b>interface</b>                                 | The point at which independent systems communicate with each other. The user interface of an application often consists of toolbars, menus, buttons, windows, and other items.                                                                   |
| <b>Internal Consistency Evaluator (ICE)</b>      | Tests that can be run on a Windows Installer database (using Orca, Msival2, or the Premier or Professional editions of InstallShield) to warn about potential (or actual) authoring errors.                                                      |
| <b>internal source files</b>                     | Files that are included in the installation archive file.                                                                                                                                                                                        |
| <b>internal user interface</b>                   | Built-in capabilities of an installer that can be used to create a graphical user interface that is displayed to the end user during installation.                                                                                               |
| <b>internet Explorer (IE)</b>                    | The browser developed by Microsoft and distributed with their Windows operating systems.                                                                                                                                                         |
| <b>ISM</b>                                       | See <a href="#">.ism file</a> .                                                                                                                                                                                                                  |

**Table 1** - InstallShield Glossary

| Term                               | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>isolated application</b>        | An application that has been modified so that it always loads the versions of components, such as .dll files, with which it was originally developed and tested.                                                                                                                                                                                                                                                                              |
| <b>ISScript.msi</b>                | InstallScript engine installer. ISScript.msi installs the required files to run an installation. The InstallScript engine is also known as the InstallShield Scripting Run Time. InstallScript is a programming language used to create installations.                                                                                                                                                                                        |
| <b>JAR</b>                         | Acronym for Java archive file. See also <a href="#">.jar file</a> .                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Java Archive</b>                | See <a href="#">.jar file</a> .                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Java Native Interface (JNI)</b> | A Java specification that enables Java code to call native code in a shared library. Native code in the JNI library can also invoke Java code through JNI.                                                                                                                                                                                                                                                                                    |
| <b>Java Virtual Machine (JVM)</b>  | A simulated computer that interprets Java programs compiled into bytecode. The Java programs are usually stored in .class files.                                                                                                                                                                                                                                                                                                              |
| <b>JNI</b>                         | See <a href="#">Java Native Interface</a> .                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>JPEG</b>                        | See <a href="#">.jpg file</a> .                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>JVM</b>                         | See <a href="#">Java Virtual Machine</a> .                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>KB</b>                          | See <a href="#">knowledge base</a> .                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>key file</b>                    | A unique file for each component that Windows Installer uses to detect the component's presence. In order to create advanced component settings or shortcuts, a key file must be specified.                                                                                                                                                                                                                                                   |
| <b>key path</b>                    | A unique registry value for each component that Windows Installer uses to detect the component's presence. A component can have either a key file or a key path, but not both.                                                                                                                                                                                                                                                                |
| <b>knowledge base (KB)</b>         | A collection of technical information, instructions, and articles that are beyond the scope of the software's help information. The Knowledge Base features tips, tricks, and techniques, answers to Frequently Asked Questions, and articles on both technical and design issues. Revenera posts periodic updates to the Knowledge Base Articles on its <a href="http://www.installshield.com">Web site (http://www.installshield.com)</a> . |
| <b>left-click</b>                  | The act of selecting the left button on a mouse.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>library</b>                     | A collection of similar objects that are stored for occasional use, such as programs in source code or object code form, data files, scripts, and templates. A program library is a collection of (usually) precompiled, reusable programming routines that a programmer can "call" when writing code.                                                                                                                                        |

**Table 1** - InstallShield Glossary

| Term                         | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>load-ordering group</b>   | One service may require another service to already be running before it starts. For this reason, services need to be grouped and set to load in a specific order. Service load-ordering groups are listed under HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\ServiceGroupOrder. The service's Start Type property determines when it loads within its group.                                                                                                                               |
| <b>localization</b>          | The process of adapting a product or service to a particular language and culture.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>log database (LogDB)</b>  | A database that is on the target machine and contains a log of everything that was configured to be logged during installation and uninstallation.                                                                                                                                                                                                                                                                                                                                                |
| <b>log file</b>              | File containing a record of the activity that occurred during a software process (such as an installation, a build, a download) on a computer workstation or Web server. For example, Web servers maintain log files listing every request made to the server, summarizing files that were copied; bytes that were transferred; or which pages, images, and files are requested. A build log file lists all features, setup types, merge modules, dynamic links, and files included in the build. |
| <b>LogDB</b>                 | See <a href="#">log database</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>logging</b>               | The process of recording the activity of a software process (such as an installation, a build, or a download) in a log file.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>macro</b>                 | An instruction that represents a sequence of instructions.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>maintenance mode</b>      | When a user runs an installation program a second (or later) time for a product already installed on their system, the installation runs in maintenance mode. Maintenance mode enables the user to modify feature selections from the first-time installation, repair the features already installed, or remove the entire program.                                                                                                                                                               |
| <b>major upgrade</b>         | A comprehensive update of the product that warrants a change in the ProductCode property. A new product code is required if you want to have two versions of a product installed on the same machine.                                                                                                                                                                                                                                                                                             |
| <b>managed application</b>   | An application is called a "managed application" if elevated (system) privileges are used to install the application.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>MD</b>                    | See <a href="#">media descriptor</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>media descriptor (MD)</b> | The semantics of an installable unit (IU). It provides a mapping of the elements in the deployment descriptor (DD) to some physical source for the data, which is usually files.                                                                                                                                                                                                                                                                                                                  |
| <b>merge module (MM)</b>     | A package containing all of the logic and files needed to install distinct pieces of functionality such as run-time .dll files and virtual machines. Merge modules are built once and can be added to any installation project.                                                                                                                                                                                                                                                                   |

| <b>metafile</b>                                 | An image saved using the standard Windows metafile format. A metafile is a set of drawing instructions. Windows metafiles have a .wmf file extension.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>MFC</b>                                      | See <a href="#">Microsoft Foundation Classes</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Microsoft Data Engine (MSDE)</b>             | A fully SQL Server-compatible data engine for building desktop and shared solutions. It provides an easy migration path to SQL Server 7.0. Solutions built with MSDE can be migrated to full SQL Server 7.0 without requiring a change in a single line of code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Microsoft Developer Network (MSDN)</b>       | A set of online and offline services designed to help developers write applications using Microsoft products and technologies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Microsoft disc operating system (MS-DOS)</b> | The first operating system created by Microsoft. MS-DOS is the underlying operating system of Windows 95, 98, and ME. Windows NT, 2000, and XP operating systems support existing DOS applications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Microsoft Foundation Classes (MFC)</b>       | A huge set of C++ classes that developers can use to write Win32 applications. To run an application that uses MFC, the MFC engine has to be installed on a target system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>MIDI</b>                                     | See <a href="#">musical instrument digital interface</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>migrating</b>                                | The process of moving from the use of one operating environment to another that is, in most cases, thought to be a better one. For example, moving from Windows NT Server to Windows 2000 Server would be considered a migration because it involves ensuring that new features are exploited and that old settings do not require changing; it also involves taking steps to ensure that current applications continue to work in the new environment. Migration could also mean moving from Windows NT to a UNIX-based operating system (or the reverse). You can also migrate data from one kind of database to another kind of database. This usually requires converting the data into some common format that can be output from the old database and input into the new database. Migration is also used to refer simply to the process of moving data from one storage device to another. |
| <b>MIME</b>                                     | See <a href="#">multipurpose internet mail extensions</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>minor upgrade</b>                            | An update to a product in which the changes made to the installation do not warrant a change in the Product Code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>MSDE named instance</b>                          | A named instance of an installation of the Microsoft data engine (MSDE). See also <a href="#">named instance</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>MSDE object template</b>                         | A base for the MSDE merge module. When you add the MSDE merge module to a Windows Installer project or an InstallScript project, the InstallShield application starts with a base file (or stub) for this merge module. You need to configure this merge module, and then the application can apply your settings to the base file.                                                                                                                                                                                                                                                                                   |

| <b>multimedia</b>                                   | A collection of various media such as sound, video, graphics, and animation used together to convey a message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>multipurpose Internet mail extensions (MIME)</b> | The standard used by Web servers to identify the files that they are sending to Web clients. The MIME standard is a way of specifying both the type of file being sent and the method that should be used to turn it back into its original form.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>musical instrument digital interface (MIDI)</b>  | A protocol designed for recording and playing back music on digital synthesizers. Unlike .wav files, which are digital recordings of actual sound (voice or music), MIDI files simply define the instruments and notes that are to be played, and how they should be played. A synthesizer (generally part of a MIDI-capable sound board) on the end-user's system reads the MIDI instructions and plays the music. Since MIDI files contain only instructions and not the actual music, they are many times smaller than digital audio files of the same duration. MIDI files also use less processor power to play. |

| Term                                      | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>named instance</b>                     | An instance is a complete and independent installation of SQL Server on a given server. One default instance and any number (up to 16) of named instances can be installed on a single server. Apart from the management tools and client connectivity components that are shared between instances, each instance is effectively standalone. Each instance has its own security, can be started and stopped independently, and can even be service packed independently of other instances on the same server. |
| <b>nested installation</b>                | A type of custom action that installs or removes another installation package (sometimes called the child product) from within a running installation (called the parent product).                                                                                                                                                                                                                                                                                                                              |
| <b>network</b>                            | A network is two or more computers connected together to share hardware, software, and information. During installation, it may be necessary to move installation files that are on a network to your computer's hard drive to install the software properly.                                                                                                                                                                                                                                                   |
| <b>NT service</b>                         | An application that is installed on Windows NT to run as a service, meaning that once it is installed, execution is automatic and transparent to any user, and a user does not have to log in for the service to start. NT manages services that are defined and described in the registry.                                                                                                                                                                                                                     |
| <b>object</b>                             | A package containing all of the logic and files needed to install distinct pieces of functionality.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>One Really Cool Application (ORCA)</b> | An external tool for editing Windows Installer files.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>One-Click Install</b>                  | With a One-Click Install installation, the end user can download an application with minimal effort and can begin using the application immediately. The installation is automatically downloaded, uncompressed, and then executed automatically, with minimal user input. End users are not asked to specify a download location, and they are not required to manually launch the installation.                                                                                                               |
| <b>operating system (OS)</b>              | The software that controls the operation of a computer and directs the processing of programs by assigning storage space in memory and controlling input and output functions.                                                                                                                                                                                                                                                                                                                                  |

| <b>package code</b>              | The globally unique identifier for an installation package. See also <a href="#">globally unique identifier (GUID)</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>panel</b>                     | A window within a wizard that contains one or more related settings that an end user can configure. See also <a href="#">wizard</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>parent/child installation</b> | See <a href="#">nested installation</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>patch</b>                     | A special type of installation package that contains just the bits and portions of the application that is necessary to either update the application's files and installation to a specific version or to fix a bug in an earlier version.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>patch file</b>                | A patch package used for patching. A patch package (.msp) file contains the transforms and instructions necessary for upgrading one or more installed versions of a product. Windows Installer uses a patch package to patch local or administrative installations. A patch package does not include a database like a regular installation package. Instead it contains at minimum one database transform that adds patching information to the database of its target installation package. The installer uses this information to apply the patch files that are stored in the cabinet file stream of the patch package.                                                                        |
| <b>patching</b>                  | The method of updating an installation that replaces only the bits being changed rather than the entire application. This means that end users can download a patch for a product that is much smaller than the entire product.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>path</b>                      | In a computer operating system, a path is the route through a file system to a particular file. A path name is the specification of that path. Each operating system has its own format for specifying a path name. The DOS, Windows, and OS/2 operating systems use the following format:<br>driveletter:directorynamesubdirectorynamefilename.suffix. UNIX-based systems use the following format: /directory/subdirectory/filename.                                                                                                                                                                                                                                                             |
| <b>path variable</b>             | A variable that represents a location that can be defined once in a central location so that it is not necessary to change every source file's path each time that the project is moved or the folder structure is changed. You can instead use path variables to define commonly used paths once, and they are used during the development of your installation project. These paths do not apply to the target machines where the application is being installed. Rather, they are used to link to source files that need to be included in your installation project. When the project is built, those links are evaluated and the files they point to are built into the installation package. |
| <b>PKCS</b>                      | See <a href="#">public-key cryptography standards</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>platform</b>                  | The operating system for which the installation program is intended. An installation technology may be limited to creating installations for a specific platform(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Term                                            | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>preview mode</b>                             | Mode for viewing the design of the user interface, or the current appearance of dialog and billboards. <i>Preview mode</i> is a term used in Windows Installer.                                                                                                                                                                                                                                                                                         |
| <b>product</b>                                  | The actual application to be installed or uninstalled.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>product code</b>                             | A string that uniquely identifies a product.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>progress bar</b>                             | The visual indication of the progress of an executable file.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>property</b>                                 | A value that has been placed on an object within an installation project that is used during installation or uninstallation by the installer or uninstaller.                                                                                                                                                                                                                                                                                            |
| <b>public property</b>                          | A global variable whose value is set by the end user or system administrator. A public property can be set or changed during installation through interaction with the user interface as well as by setting the property on the command line, by applying a transform, or by using a standard or custom action. Unlike private property values, the values of public properties can be changed. Public property names cannot contain lowercase letters. |
| <b>public-key cryptography standards (PKCS)</b> | Developed by RSA Security, Inc., these specifications standardize aspects of public-key cryptography that are not covered by existing standards bodies.                                                                                                                                                                                                                                                                                                 |
| <b>publishing</b>                               | A type of advertising (“just-in-time” installation) in which no user-interface elements are created for the component during installation, but the component can still be installed through Add and Remove Programs of the Control Panel or when an installed component requests the published component from the installer.                                                                                                                            |
| <b>qualified component</b>                      | A method of single-level indirection that is similar to a pointer. Qualified components are primarily used to group components with parallel functionality into categories.                                                                                                                                                                                                                                                                             |
| <b>QuickPatch</b>                               | A special type of patch package that contains just the bits and portions of the database necessary to update your application’s files and installation to a specific version. You can create a QuickPatch in InstallShield by using the QuickPatch type of project.                                                                                                                                                                                     |
| <b>readme file</b>                              | A text file that is included with the distribution of an application that contains important information. This information often pertains to the installation, uninstallation, or functionality that may not have been included in other product documentation.                                                                                                                                                                                         |
| <b>red green blue (RGB)</b>                     | The three colors of light that can be mixed to produce any other color. Colored images are often stored as a sequence of RGB triplets or as separate red, green, and blue overlays, though these are not the only possible representations. These three colors correspond to the three “guns” in a color cathode ray tube (CRT) and to the color receptors in the human eye.                                                                            |

Table 1 • InstallShield Glossary

| Term                               | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>redistributable</b>             | A merge module, object, or other file that may be legally distributed with an installation or application.                                                                                                                                                                                                                                                                                                                                            |
| <b>reduced user interface (UI)</b> | The reduced UI level displays authored modeless dialogs, built-in modal error messages, and disc-prompt messages during installation. This UI level does not display any authored modal dialogs. This UI level uses the installer's internal user interface capabilities. See also <a href="#">modal</a> , <a href="#">modeless</a> , and <a href="#">internal user interface</a> .                                                                   |
| <b>reference count</b>             | A tally that is incremented each time a shared file is installed. It is maintained under HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\SharedDLLs.                                                                                                                                                                                                                                                                                     |
| <b>refresh build</b>               | This type of build only recompiles custom code. It can also perform single file replacement, meaning it can only rebuild and add or modify a single changed file without rebuilding the entire installation. This type of build is available for InstallScript projects only.                                                                                                                                                                         |
| <b>Regedt32.exe, Regedit.exe</b>   | The two versions of the Windows Registry Editor. The Registry Editor enables you to edit the entries in the registry. Regedt32 provides more functionality for editing the registry. If errors occur during installation, you may need to edit the registry to complete installation. Regedt32.exe and Regedit.exe have been merged in Windows XP computers, thus these two applications perform the same functionality in the new operating systems. |
| <b>registry</b>                    | A central database used by the Windows operating system to track the personal settings and the software and hardware installed on a computer. During installation, installation choices are written to the registry.                                                                                                                                                                                                                                  |
| <b>registry file</b>               | A text file of a predefined format that contains keys and values that can be merged into a registry.                                                                                                                                                                                                                                                                                                                                                  |
| <b>reinstallation</b>              | When a product has been installed on a machine and its installation is run again, the installation reinstalls the product by overwriting its existing files, shortcuts, and registry entries.                                                                                                                                                                                                                                                         |
| <b>relative path</b>               | A path that includes all of the information necessary to locate a file by starting at the current folder on the current drive, for example, InstallShield\Support. That folder can be located along that relative path only if it exists in the current directory.                                                                                                                                                                                    |
| <b>release build</b>               | A full rebuild fit for releasing.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>release notes</b>               | A file that is included with the distribution of an application. This file contains important information about the installation and uninstallation of the application. It can also contain information that may not have been included in other product documentation.                                                                                                                                                                               |

Table 1 • InstallShield Glossary

| Term                                    | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>remote procedure call (RPC) stub</b> | A small routine placed in a program that is used to request a service on another computer. RPC is a protocol, or agreed-upon format for transmitting data, that allows a program to request a service from a program located in another computer. The stub accepts the request from the program and forwards it to the remote procedure. When the procedure is complete, the stub receives the result and passes it back to the program that made the request. |
| <b>repair mode</b>                      | In repair mode, the installation checks for any type of corruption, such as missing or damaged files, incorrect registry entries, and self-registering files. If the installation detects any corruption, it attempts to repair the problem. See also <a href="#">maintenance mode</a> .                                                                                                                                                                       |
| <b>resiliency</b>                       | The ability for the application to reinstall components as necessary. If a component is accidentally deleted or corrupted, Windows Installer technology enables the application to essentially repair itself.                                                                                                                                                                                                                                                  |
| <b>restricted public property</b>       | A global variable for which the installation author can limit the ability to set or change it. Usually, only system administrators can manipulate restricted public properties. Restrictions are used to maintain a secure environment.                                                                                                                                                                                                                        |
| <b>result set</b>                       | The set of rows created by executing a <b>SELECT</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>RGB</b>                              | See <a href="#">red green blue</a> .                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>rich text format (RTF)</b>           | A Microsoft file format that contains special commands to indicate formatting information such as fonts and margins. RTF lets you exchange files between different word processors and operating systems.                                                                                                                                                                                                                                                      |
| <b>rollback</b>                         | The installation keeps track of all changes that are made during the installation process so that, if an error occurs and the installation is aborted, the changes will be “rolled back,” that is, the machine will be restored to its original state.                                                                                                                                                                                                         |
| <b>row</b>                              | A set of related columns that describe a specific entity, also known as a <i>record</i> .                                                                                                                                                                                                                                                                                                                                                                      |
| <b>RPC stub</b>                         | See <a href="#">remote procedure call stub</a> .                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>RTF</b>                              | See <a href="#">rich text format</a> .                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>run time</b>                         | The time during which the installation interacts with the installer to install or uninstall your application on the target machine.                                                                                                                                                                                                                                                                                                                            |
| <b>safe mode</b>                        | Safe mode is a troubleshooting mode available in Windows 95, 98, ME, and 2000. When you start your computer in safe mode, only the operating system and mouse, keyboard, and display drivers are loaded. You may be able to start your computer in safe mode when it otherwise would not start at all. Safe mode lets you troubleshoot the operating system to determine what is not functioning properly.                                                     |

Table 1 • InstallShield Glossary

| Term                                 | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>schema</b>                        | A description of the current structure of tables and views in a data source. The schema describes what columns are in each table, the data type of each column, and the relationships between tables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SCM</b>                           | See <a href="#">Service Control Manager</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>SDK</b>                           | See <a href="#">Software Development Kit</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Section 508</b>                   | A United States law that amended the Rehabilitation Act to require federal agencies to make their electronic and information technology accessible to people with disabilities. Section 508 was enacted to eliminate barriers in information technology, to make available new opportunities for people with disabilities, and to encourage development of technologies that will help achieve these goals. The law applies to all federal agencies when they develop, procure, maintain, or use electronic and information technology. Under Section 508, agencies must give disabled employees and members of the public access to information that is comparable to the access available to others. |
| <b>security tool</b>                 | A privacy tool that detects and eliminates destructive pests, such as Trojans, spyware, addware, and hacker tools on your computer. It complements anti-virus and firewall software, extending protection against non-viral malicious software that can evade the end user's existing security and invade privacy.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>self-healing</b>                  | See <a href="#">auto-repair</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>self-registering file</b>         | A file that can enter information about itself in the Windows registry and remove that information upon uninstallation. Other types of files can be used without entering information into the registry. The installation of a self-registering file consists of installing the file to its desired location and then registering the file on your computer.                                                                                                                                                                                                                                                                                                                                           |
| <b>sequence</b>                      | A collection of actions and dialogs that is executed sequentially in an installation project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>sequence tables</b>               | Tables that list the actions that control the installation process and specify their order of execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>service</b>                       | For Windows Installer-based or InstallScript-based projects, this is a program that runs in the background whenever a computer is running. Services perform tasks that do not require user interaction, such as software installation, process monitoring, file transfer, task scheduling, network management, and many more. In Win32, services are managed by the Service Control Manager.                                                                                                                                                                                                                                                                                                           |
| <b>Service Control Manager (SCM)</b> | Maintains the system's database of services and exposes an interface for controlling these services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>service pack (SP)</b>              | An update to a software product that fixes existing problems and may provide product enhancements. The next version of a product incorporates all services packs previously released.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>setup</b>                          | See <a href="#">installation</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>setup project</b>                  | See <a href="#">installation project</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Setup.inx</b>                      | The compiled script file. It is the object code that the installer engine executes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>shortcut</b>                       | A file that points to an application. Clicking the shortcut is a fast way to open the application. Shortcuts are usually placed on the desktop or on the Start menu. See also <a href="#">advertised shortcut</a> .                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>silent installation</b>            | An installation that is run without a user interface or any end user intervention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>small update</b>                   | A patch that upgrades a package where both the installed package and the most recent one have the same version number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>software development kit (SDK)</b> | The documentation, samples, command-line compilers, debugging aids, utilities, and tools designed to enable developers to create applications and libraries that target a specific operating system. SDKs are usually provided by the manufacturer of the operating system.                                                                                                                                                                                                                                                                                                                              |
| <b>source list</b>                    | A list that specifies the locations where the installer searches for installation files. The entries in the source list can be network locations, URLs, or compact disks.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>SP</b>                             | See <a href="#">service pack</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>splash screen</b>                  | An image that is displayed to end users during the startup of a product installation. You can specify the image to be displayed, the length of time that it should display, and whether it contains localized images.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>spyware</b>                        | Any technology that aids in gathering information about a person or organization without their knowledge. On the Internet, spyware is programming that is put on someone's computer to secretly gather information about the user and relay it to advertisers or other interested parties. Spyware can be loaded on a computer as a software virus or as the result of installing a new program. Data collecting programs that are installed with the user's knowledge are not, properly speaking, spyware, if the user fully understands what data is being collected and with whom it is being shared. |
| <b>SQL</b>                            | See <a href="#">Structured Query Language</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>SQL statement</b>                  | A complete phrase in SQL that begins with a keyword and completely describes an action to be taken. For example, <code>SELECT * FROM Orders</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 1** - InstallShield Glossary

| Term                                   | Definition                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>standard action</b>                 | An action that is built into an installation development software product. InstallShield products also support the creation and use of custom actions. See also <a href="#">action</a> , <a href="#">custom action</a> .                                                                                                                                           |
| <b>string table</b>                    | A database that maintains the string IDs, values, and comments for all supported languages. These strings are used in dialogs and message boxes displayed to the end user at run time.                                                                                                                                                                             |
| <b>Structured Query Language (SQL)</b> | A language used to work with databases.                                                                                                                                                                                                                                                                                                                            |
| <b>summary information stream</b>      | The properties such as title, author, package code, templates, summary, and schema that are defined for a Windows Installer package and are used by the installer to install the application.                                                                                                                                                                      |
| <b>synchronous execution</b>           | The opposite of asynchronous execution, where control of the process is not released until the entire process has completed.                                                                                                                                                                                                                                       |
| <b>system policy</b>                   | The rules and regulations by which a system must abide.                                                                                                                                                                                                                                                                                                            |
| <b>system privileges</b>               | The system, programs, and functions available to each user.                                                                                                                                                                                                                                                                                                        |
| <b>table</b>                           | A collection of rows of data.                                                                                                                                                                                                                                                                                                                                      |
| <b>TARGETDIR</b>                       | In a Windows Installer-based installation, the TARGETDIR property specifies the root destination directory for the installation. In an InstallScript installation, the TARGETDIR system variable, by default, specifies the root destination directory for the installation.                                                                                       |
| <b>Task Manager</b>                    | A tool available on Windows platforms that provides information about the applications and processes running on your computer as well as your computer's performance. Prior to installation, you may need to use the Task Manager to end running applications and processes to prevent conflicts.                                                                  |
| <b>temp directory</b>                  | A folder on your hard drive where the operating system or applications can temporarily store files while they are in use. When the application exits, the temporary files are deleted. It may be necessary to manually clean, or delete files from, the temp directory.                                                                                            |
| <b>template</b>                        | Something that establishes or serves as a pattern.                                                                                                                                                                                                                                                                                                                 |
| <b>transform</b>                       | A transform (.mst) file represents the differences between two installation databases. For example, network administrators may want to distribute different configurations of a product to the various departments in the company. As a result, you can create a transform for every configuration of the product, then apply the appropriate transform as needed. |

Table 1 • InstallShield Glossary

| Term                                            | Definition                                                                                                                                                                                                                                 |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>transform error condition flags</b>          | A set of properties that are used to set the error conditions in a transform.                                                                                                                                                              |
| <b>transform validation flags</b>               | The set of properties used to verify that a transform can be applied to the Windows Installer package.                                                                                                                                     |
| <b>tree node</b>                                | A data structure that contains zero or more “child” nodes. Nodes are tree “roots”. Tree nodes that do not have “children” are typically referred to as “leaves”.                                                                           |
| <b>trees</b>                                    | Data that is structured like a tree.                                                                                                                                                                                                       |
| <b>UI</b>                                       | See <a href="#">user interface</a> .                                                                                                                                                                                                       |
| <b>uncompress</b>                               | See <a href="#">decompress</a> .                                                                                                                                                                                                           |
| <b>uniform/universal resource locator (URL)</b> | Represents the location of a Web site or page.                                                                                                                                                                                             |
| <b>uninstallation</b>                           | The undoing of an installation. Uninstallation is the installation maintenance option that enables the end user to remove the product files and reverse any changes that were made to the machine made during installation.                |
| <b>uninstallation log file</b>                  | A record of all uninstallation-related events that occurred during an installation. The log file is initialized at the beginning of the installation. If this log file becomes corrupted, it may result in an error during uninstallation. |
| <b>unInstallShield</b>                          | A component included in the Setup Wizard that uninstalls the product from the end user's PC.                                                                                                                                               |
| <b>unspanned CD/DVD media type</b>              | The payload is laid out in a CD/DVD archive, but no spanning across multiple media is used.                                                                                                                                                |
| <b>Update Manager (Windows or Java)</b>         | An optional Win32 or Java-based client application that can be used by end users to set their own update schedules, or to silence the update queries performed by the agent.                                                               |
| <b>upgrade</b>                                  | A move from a lesser version of an application to a newer, usually improved version of an application.                                                                                                                                     |
| <b>upgrade code</b>                             | The code required to install a newer version of existing software.                                                                                                                                                                         |
| <b>upgrading</b>                                | The process of installing a newer version of existing software.                                                                                                                                                                            |
| <b>URL</b>                                      | See <a href="#">uniform/universal resource locator</a> .                                                                                                                                                                                   |
| <b>user interface (UI)</b>                      | The user's access to the software.                                                                                                                                                                                                         |

Table 1 • InstallShield Glossary

| Term                             | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>user profile</b>              | Record of an individual end user's settings, such as shortcuts, favorites, and settings for application, display, and hardware. User profiles enable multiple users to share a single computer while maintaining their own preferences.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>validation</b>                | The process of validating, that is, to confirm the true form of data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>value pack (VP)</b>           | An installation that upgrades the features and functions of an installed application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>variable</b>                  | A value stored in the computer. Its value can be composed of any printable characters, numeric or text. Unlike a constant, whose value never changes, a variable's value can be changed at any time.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>volume</b>                    | The total amount of space, in blocks, on one piece of media.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>VP</b>                        | See <a href="#">value pack</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Web installation</b>          | An installation that end users can access and run from a Web site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Web site</b>                  | A location on the World Wide Web.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>WinDir</b>                    | Stores the path to the executable file for Win16 on Win32 (WOW).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>window</b>                    | The area in which an open application appears on a screen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Windows API</b>               | The Windows application programming interface (API), which provides the building blocks that are used by applications written for the Windows platform. Each API is a specific method prescribed by a computer operating system or by an application program. A programmer writing an application can make requests of the operating system or another application with the use of a Windows API. Each API has different system requirements to run properly.                                                                                                                                                 |
| <b>Windows installation CD</b>   | The compact disc that contains the Windows operating system. If your computer manufacturer installed the operating system on your computer, the installation CD should have been included with your computer documentation. If you installed the Windows operating system on your computer, you used the installation CD to do so.                                                                                                                                                                                                                                                                            |
| <b>Windows Installer</b>         | <p>(1) An installation and configuration service. It is based on a data-driven model and provides all installation data and instructions in a single, complete package. In the data-driven installation model, a primary set of installation tables is created where every application resource (files, registry keys, and so on) is clearly tied to the component or feature it supports. The user selects the objects to install and where to install them, and the Windows Installer manages the procedural instructions.</p> <p>(2) Refers to the service, properties, and tables of an .msi package.</p> |
| <b>Windows Installer service</b> | An operating system component that centrally manages application installation configuration and application uninstallation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Term                         | Definition                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Windows NT service</b>    | See <a href="#">Windows service</a> .                                                                                                                                                                                                                                                                                                                                                            |
| <b>Windows service</b>       | Long-running executable applications that run in their own Windows sessions. For example, writing messages to an event log.                                                                                                                                                                                                                                                                      |
| <b>Windows system folder</b> | Contains core operating system files, which are necessary to keep the computer running properly. Errors occurring during installation may be a result of missing or corrupt files contained in the System folder.                                                                                                                                                                                |
| <b>wizard</b>                | <p>(1) A program utility that works as an interactive guide by walking the user step-by-step through an unfamiliar task.</p> <p>(2) The InstallShield Wizard is the wizard that displays during the run time of an installation or uninstallation. It presents the end user with a flexible, predefined series of dialogs that walk them through the installation or uninstallation process.</p> |
| <b>wizard dialog</b>         | Dialogs that display to the end user during installation and uninstallation. They enable end users to interact with the operation by reading or specifying information.                                                                                                                                                                                                                          |
| <b>wizard interface</b>      | Used by the end user to interact with a wizard at run time.                                                                                                                                                                                                                                                                                                                                      |
| <b>WYSIWYG</b>               | What you see is what you get.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>XCopyFile</b>             | An InstallScript function that copies one or more files and subdirectories to a target directory, creating subdirectories on the target machine, if necessary.                                                                                                                                                                                                                                   |
| <b>XML</b>                   | See <a href="#">extensible markup language</a> .                                                                                                                                                                                                                                                                                                                                                 |
| <b>XSL</b>                   | See <a href="#">extensible stylesheet language</a> .                                                                                                                                                                                                                                                                                                                                             |

  - required properties 1838
  - restricted public properties 1838
  - using 1868
- Proxy server settings 1449
- Proxy support for server application 1216
  - conditionally installing COM+ application 1217
- Publishing components 652
- Push button control 1087
- PVK2PFX 1310

## Q

QP 2155

- QuickPatch
  - built-in InstallShield custom actions for 1678
  - how InstallShield creates 1678
  - streamlining creation of 1678
  - streamlining limitations 1678
- QuickPatch projects 316
  - Create New QuickPatch Wizard 2151
  - custom action 2863
  - files 2863
  - history 2863
  - procedures for 1677
  - registry 2866

## R

- Radio button control 1091
- Radio button group control 1094
- Rebooting target machine 1579
  - during an installation or uninstallation (InstallScript or InstallScript MSI) 1429
  - specifying for prerequisites 1575
- Redistributables 2508
  - .NET Framework and language packs 707
  - adding merge modules to gallery of 681
  - adding to InstallScript projects 684
  - adding to Windows Installer-based projects 683
  - downloading latest ones to your machine 678
  - InstallShield 673
  - InstallShield prerequisites 687
  - live gallery for 675
  - managing gallery of 675
  - obtaining updates for 464
- Reevaluate condition 630
- REG files 768
  - Multi-line string support 2025
- registering COM servers 718
- Registry 482, 505
  - enabling or disabling reflection of 639
  - Reg-Free COM 725
- Registry entries 755
  - creating keys 758
  - exporting REG files 769
  - finding text in a component's registry data 765
  - flags 764
  - for per-user installations 772
  - importing REG files 768
  - key paths 769
  - registering values 761
  - setting uninstall behavior 766
- Registry reflection 639
- Release flags 1314
- Release Wizard 478, 500
- Release wizard 2225
- ReleasePackager.exe 3630

## Releases

- leaving files uncompressed in a disk image [1302](#)

- Remote installation [666](#)

- RemoveComponent method [3252](#)

- RemoveComponentSubFolder Method [3233](#)

- RemoveDynamicFileLinking method [3234](#)

- RemoveEnvironmentVar method [3235](#)

- RemoveFeature method [3199](#)

- RemoveFile method [963](#)

- RemoveMergeModule method [3253](#)

- RemoveObject Method [3254](#)

- RemovePackage method (Advanced UI, Suite/Advanced UI) [3513](#)

- RemoveRemoveFile method [3236](#)

- RemoveSequenceRecord method [3425](#)

## Removing

- InstallShield prerequisites from projects [686](#)

- InstallShield prerequisites from redistributables gallery [679](#)

- merge modules and objects from projects [686](#)

- merge modules from redistributables gallery [682](#)

- server locations [1462](#)

- Repository [324](#)

- overview [324](#)

- setting up network [325](#)

- Required Execution Level setting [1303](#)

- requirements for target machines [332](#)

- when installations check for [333](#)

- Response transform [1460](#)

- creating [1460](#)

- modifying [1461](#)

- Restarting target machine [1579](#)

- affect on UAC prompts for Windows Vista and later [524](#)

- during an installation or uninstallation (InstallScript or InstallScript MSI) [1429](#)

- specifying for prerequisites [1575](#)

- Return values [2997](#)

- Setup.exe run time (Basic MSI and InstallScript MSI) [2997](#)

- Setup.exe run time (InstallScript) [2994](#)

- Setup.exe run time (Suite/Advanced UI and Advanced UI) [3001](#)

- Right-to-left language support [466](#)

- Roles [1499](#)

- enabling Windows features and [1499](#)

- Rollback [942](#)

- RTL language support [466](#)

- Running an installation [475](#), [1340](#)

- multiple times [550](#)

- running multiple .msi files simultaneously [687](#)

- with InstallShield prerequisites [697](#)

## S

- Save As dialog box [2098](#)

- SaveProject method [3200](#)

- SaveProject method (Advanced UI, Suite/Advanced UI) [3468](#)

## Saving

- InstallShield prerequisites [1585](#)

- project with new name or location [319](#)

- Script editor [2637](#)

- Script Files [832](#)

- Scrollable text control [1098](#)

- Sd Dialog Static Text Fields [978](#)

- secondary window [1115](#)

- adding a blank one [1129](#)

- adding a control to [1130](#)

- background for [1121](#)

- displaying ampersands in text [1132](#)

- keyboard shortcuts for [1132](#)

- tab order for [1131](#)

- Security [1310](#)

- Selection tree control [1100](#)

- Self-extracting executable files [1279](#)

- building [1301](#)

- building from the command line [1279](#)

- using ReleasePackager.exe to build [3630](#)

- Self-registering files [483](#), [507](#), [723](#)

- specifying order of self-registration [724](#)

## Self-registration

- COM server support [719](#)

- Sequences [2638](#)

- Administration sequence [935](#)

- Advertisement sequence [933](#)

- custom actions [943](#)

- Execute sequence [938](#)

- for installing prerequisites [692](#)

- for small-update patches [1663](#)

- insert an action [938](#)

- Installation sequence [922](#)

- User Interface sequence [937](#)

- Server [1217](#)

- location

- adding [1462](#)

- change the order of multiple [1463](#)

- modifying [1462](#)

- removing [1462](#)

- specify for application proxy [1216](#)

- Server Configuration view [2588](#)

- services [821](#)

- installing, starting, stopping, deleting, uninstalling, and configuring [821](#)

- setAllUsersProfile2K custom action [3605](#)

- SetAllUsersProfileNT custom action [3605](#)

- SetARPINSTALLLOCATION custom action [3605](#)

- SetARPreadme (custom action) [561](#)

- SetProperty Method [1327](#)
- Settings.xml [367](#)
- Setup Best Practices [608](#)
  - setup design monitoring [2032](#)
- Setup Design views [2408](#)
- Setup prerequisites
  - obtaining updates for [464](#)
  - User Account Control prompts and [524](#)
- Setup types [477](#), [2460](#)
